W. Fisher,Thomas S. Bellows,L. E. Caltagirone,D. L. Dahlsten,Carl B. Huffaker,G. Gordh,1999-09-20 For many years the use of chemical agents such as pesticides and herbicides has been effective in controlling the many varieties of pests that infest both agricultural crops and backyard gardens However these pests are gradually becoming resistant to these agents because the agents themselves are acting as selective factors making the pests better and better able to resist and persist As a result the use of biological controlling agents is increasing This book is a comprehensive and authoritative handbook of biological control Journal of Biological Control ,2001 **Recent Developments in**

provides a solid introduction to the theory and practice of natural pesticide use including in depth discussions of integrated management systems for weed and pest control the state of the art use of computers in pest management and allelochemicals as natural protection Guidelines on toxicological testing and EPA regulation of natural pesticides are also detailed **Nematologica**, 1984 **The IPM Practitioner**, 1991 **Soil Biota Management in Sustainable Farming Systems** C. Reddy, 1997 **Canadian Journal of Microbiology**, 1987-07 **Mathematical model for the biocontrol of vector-borne viral diseases in solanaceous vegetable plants** Timothy Ado Shamaki, 2023-03-03 Doctoral Thesis Dissertation from the year 2022 in the subject Mathematics Applied Mathematics Modibbo Adama University of Technology Yola language English abstract This thesis treats the issue of Vector Borne Virus Diseases VBVDs that are transmitted in solanaceous vegetable plants by incorporating three species of vectors aphids thrips and whiteflies A mathematical model was developed that used lady beetles as biological control agents for controlling the spread of diseases in solanaceous vegetable plants through predation The research adopted the linearization method This research is restricted to a biological control of VBVDs of solanaceous vegetable plants using compartmental modeling approach The model is a system of first order nonlinear ODEs Additionally the study is limited to three solanaceous plants i.e tomato pepper and eggplant This is because solanaceous plants are among the world's most cultivated crops and given proper conditions and regular maintenance they are relatively easy to grow We focused on viral diseases that affect solanaceous vegetable plants especially Yellow Leaf Curl Virus YLCV Spotted Wilt Virus SWV and Cucumber Mosaic Virus CMV It is a common knowledge that these plant viruses also require some sort of carrier known as vectors to transmit the pathogen from plant to plant Therefore the study is demarcated to a class of aphids green peach aphids thrips *T. tabasi* and whiteflies *Bemisia tabasi* because these ones are reported as the common problem associated with solanaceous plants which can be controlled by natural predatory enemies ladybugs *hippodamia convergens* **Microbial Inoculation of Crop Plants** Richard Ewen Campbell, R. Bottrell, Council on Environmental Quality (U.S.), 1979 Integrated pest management IPM is the selection integration and implementation of pest control based on predicted economic ecological and sociological consequences IPM seeks maximum use of naturally occurring pest controls including weather disease agents predators and

parasites In addition IPM utilizes various biological physical and chemical control and habitat modification techniques Artificial controls are imposed only as required to keep a pest from surpassing intolerable population levels predetermined from accurate assessments of the pest damage potential and the ecological sociological and economic costs of the control measures The presence of a pest species does not necessarily justify action for its control and in fact tolerable infestations may be desirable providing food for important beneficial insects for example [Bulgarian Journal of Agricultural Science](#), 2004
