Operator Theoretic Aspects Of Ergodic Theory Graduate Texts In Mathematics:

Operator Theoretic Aspects of Ergodic Theory Tanja Eisner, Bálint Farkas, Markus Haase, Rainer Nagel, 2015-11-18
Stunning recent results by Host Kra Green Tao and others highlight the timeliness of this systematic introduction to classical ergodic theory using the tools of operator theory Assuming no prior exposure to ergodic theory this book provides a modern foundation for introductory courses on ergodic theory especially for students or researchers with an interest in functional analysis While basic analytic notions and results are reviewed in several appendices more advanced operator theoretic topics are developed in detail even beyond their immediate connection with ergodic theory As a consequence the book is also suitable for advanced or special topic courses on functional analysis with applications to ergodic theory Topics include an intuitive introduction to ergodic theory an introduction to the basic notions constructions and standard examples of topological dynamical systems Koopman operators Banach lattices lattice and algebra homomorphisms and the Gelfand Naimark theorem measure preserving dynamical systems von Neumann s Mean Ergodic Theorem and Birkhoff s Pointwise Ergodic Theorem strongly and weakly mixing systems an examination of notions of isomorphism for measure preserving systems Markov operators and the related concept of a factor of a measure preserving system compact groups and semigroups and a powerful tool in their study the Jacobs de Leeuw Glicksberg decomposition an introduction to the spectral theory of dynamical systems the theorems of Furstenberg and Weiss on multiple recurrence and applications of dynamical systems to combinatorics theorems of van der Waerden Gallai and Hindman Furstenberg s Correspondence Principle theorems of Roth and Furstenberg S rk zy Beyond its use in the classroom *Operator Theoretic Aspects of Ergodic Theory* can serve as a valuable foundation for doing research at the intersection of ergodic theory and operator theory

Operator Theory, Function Spaces, and Applications Tanja Eisner, Birgit Jacob, André Ran, Hans Zwart, 2016-09-24 This volume collects a selected number of papers presented at the International Workshop on Operator Theory and its Applications IWOTA held in July 2014 at Vrije Universiteit in Amsterdam Main developments in the broad area of operator theory are covered with special emphasis on applications to science and engineering The volume also presents papers dedicated to the eightieth birthday of Damir Arov and to the sixty fifth birthday of Leiba Rodman both leading figures in the area of operator theory and its applications in particular to systems theory

Riesz Transforms, Hodge-Dirac Operators and Functional Calculus for Multipliers Cédric Arhancet, Christoph Kriegler, 2022-05-05 This book on recent research in noncommutative harmonic analysis treats the L_p boundedness of Riesz transforms associated with Markovian semigroups of either Fourier multipliers on non abelian groups or Schur multipliers The detailed study of these objects is then continued with a proof of the boundedness of the holomorphic functional calculus for Hodge Dirac operators thereby answering a question of Junge Mei and Parcet and presenting a new functional analytic approach which makes it possible to further explore the connection with noncommutative geometry These L_p operations are then shown to yield new examples of quantum compact metric spaces

and spectral triples The theory described in this book has at its foundation one of the great discoveries in analysis of the twentieth century the continuity of the Hilbert and Riesz transforms on L_p In the works of Lust Piquard 1998 and Junge Mei and Parcet 2018 it became apparent that these L_p operations can be formulated on L_p spaces associated with groups Continuing these lines of research the book provides a self contained introduction to the requisite noncommutative background Covering an active and exciting topic which has numerous connections with recent developments in noncommutative harmonic analysis the book will be of interest both to experts in non commutative L_p spaces and analysts interested in the construction of Riesz transforms and Hodge Dirac operators

Unbounded Weighted Composition

Operators in L_2 -Spaces Piotr Budzyński, Zenon Jabłoński, Il Bong Jung, Jan Stochel, 2018-05-28 This book establishes the foundations of the theory of bounded and unbounded weighted composition operators in L_2 spaces It develops the theory in full generality meaning that the corresponding composition operators are not assumed to be well defined A variety of seminormality properties of unbounded weighted composition operators are characterized The first ever criteria for subnormality of unbounded weighted composition operators are provided and the subtle interplay between the classical moment problem graph theory and the injectivity problem for weighted composition operators is revealed The relationships between weighted composition operators and the corresponding multiplication and composition operators are investigated The optimality of the obtained results is illustrated by a variety of examples including those of discrete and continuous types The book is primarily aimed at researchers in single or multivariable operator theory

Mystery Of Time, The: Asymmetry Of Time And Irreversibility In The Natural Processes Alexander Leonidovich Kuzemsky, 2022-10-14 The book focuses on the study of the temporal behavior of complex many particle systems The phenomenon of time and its role in the temporal evolution of complex systems is a remaining mystery The book presents the necessity of the interdisciplinary point of view regarding on the phenomenon of time The aim of the present study is to summarize and formulate in a concise but clear form the trends and approaches to the concept of time from a broad interdisciplinary perspective exposing tersely the complementary approaches and theories of time in the context of thermodynamics statistical physics cosmology theory of information biology and biophysics including the problem of time and aging Various approaches to the problem show that time is an extraordinarily interdisciplinary and multifaceted underlying notion which plays an extremely important role in various natural complex processes

Positive Operator Semigroups András Bátkai, Marjeta Kramar Fijavž, Abdelaziz Rhani, 2017-02-13 This book gives a gentle but up to date introduction into the theory of operator semigroups or linear dynamical systems which can be used with great success to describe the dynamics of complicated phenomena arising in many applications Positivity is a property which naturally appears in physical chemical biological or economic processes It adds a beautiful and far reaching mathematical structure to the dynamical systems and operators describing these processes In the first part the finite dimensional theory in a coordinate free way is developed which is difficult to find in literature This

is a good opportunity to present the main ideas of the Perron Frobenius theory in a way which can be used in the infinite dimensional situation Applications to graph matrices age structured population models and economic models are discussed The infinite dimensional theory of positive operator semigroups with their spectral and asymptotic theory is developed in the second part Recent applications illustrate the theory like population equations neutron transport theory delay equations or flows in networks Each chapter is accompanied by a large set of exercises An up to date bibliography and a detailed subject index help the interested reader The book is intended primarily for graduate and master students The finite dimensional part however can be followed by an advanced bachelor with a solid knowledge of linear algebra and calculus

Current Trends in Analysis and Its Applications Vladimir V. Mityushev, Michael V. Ruzhansky, 2015-02-04 This book is a collection of papers from the 9th International ISAAC Congress held in 2013 in Krak w Poland The papers are devoted to recent results in mathematics focused on analysis and a wide range of its applications These include up to date findings of the following topics Differential Equations Complex and Functional Analytic Methods Nonlinear PDE Qualitative Properties of Evolution Models Differential and Difference Equations Toeplitz Operators Wavelet Theory Topological and Geometrical Methods of Analysis Queueing Theory and Performance Evaluation of Computer Networks Clifford and Quaternion Analysis Fixed Point Theory M Frame Constructions Spaces of Differentiable Functions of Several Real Variables Generalized Functions Analytic Methods in Complex Geometry Topological and Geometrical Methods of Analysis Integral Transforms and Reproducing Kernels Didactical Approaches to Mathematical Thinking Their wide applications in biomathematics mechanics queueing models scattering geomechanics etc are presented in a concise but comprehensible way such that further ramifications and future directions can be immediately seen

Function Spaces and Operators between them José Bonet, David Jornet, Pablo Sevilla-Peris, 2023-10-28 The aim of this work is to present in a unified and reasonably self contained way certain aspects of functional analysis which are needed to treat function spaces whose topology is not derived from a single norm their topological duals and operators between those spaces We treat spaces of continuous analytic and smooth functions as well as sequence spaces Operators of differentiation integration composition multiplication and partial differential operators between those spaces are studied A brief introduction to Laurent Schwartz s theory of distributions and to Lars H rmander s approach to linear partial differential operators is presented The novelty of our approach lies mainly on two facts First of all we show all these topics together in an accessible way stressing the connection between them Second we keep it always at a level that is accessible to beginners and young researchers Moreover parts of the book might be of interest for researchers in functional analysis and operator theory Our aim is not to build and describe a whole complete theory but to serve as an introduction to some aspects that we believe are interesting We wish to guide any reader that wishes to enter in some of these topics in their first steps Our hope is that they learn interesting aspects of functional analysis and become interested to broaden their knowledge about function and sequence spaces and operators between them The text is addressed to students

at a master level or even undergraduate at the last semesters since only knowledge on real and complex analysis is assumed. We have intended to be as self contained as possible and wherever an external citation is needed we try to be as precise as we can. Our aim is to be an introduction to topics in or connected with different aspects of functional analysis. Many of them are in some sense classical but we tried to show a unified direct approach, some others are new. This is why parts of these lectures might be of some interest even for researchers in related areas of functional analysis or operator theory. There is a full chapter about transitive and mean ergodic operators on locally convex spaces. This material is new in book form. It is a novel approach and can be of interest for researchers in the area.
