True-time All Optical Performance Monitoring by Means of Optical Correlation Feras M. Abou-Galala, 2007 In this dissertation we present a new design of an optical performance monitor OPM that utilizes optical correlation techniques to produce real time measurements of optical link performance We also introduce a novel design of temporal optical correlator that is based on the White cell We show the advantages of our method over existing techniques and outline how our proposed device can be integrated in next generation all optical Internet networks

Optical Performance Monitoring for Amplified Spontaneous Emission Related Issues in Transparent Optical Networks
Michał Paweł Dłubek, 2009 Multi-impairment and Multi-channel Optical Performance Monitoring L. Meflah, 2008 Next generation optical networks will evolve from static to dynamically reconfigurable architectures to meet the increasing bandwidth and service requirements The benefits of dynamically reconfigurable networks improved operations reduced footprint and cost have introduced new challenges in particular the need for complex management which has put pressure on the engineering rules and transmission margins This has provided the main drive to develop new techniques for optical performance monitoring OPM without using optical to electrical to optical conversions When considering impairments due to chromatic dispersion in dynamic networks each channel will traverse a unique path through the network thus the channels arriving at the monitoring point will in general exhibit different amounts of residual dispersion Therefore in a dynamic network it is necessary to monitor all channels individually to quantify the degradation without the requirement of knowing

the data path history. The monitoring feature can be used in conjunction with a dispersion compensation device which can either be optical or electrical or used to trigger real time alarms for traffic re-routing. The proposed OPM technique is based on RF spectrum analysis and used for simultaneous and independent monitoring of power, chromatic dispersion (CD), polarisation mode dispersion (PMD) and optical signal to noise ratio (OSNR) in 40Gbit/s multi-channel systems. An analytical model is developed to describe the monitoring technique which allows the prediction of the measurement range. The experimental results are given for group velocity dispersion (GVD), differential group delay (DGD) and OSNR measurements. This technique is based on electro-optic down conversion that simultaneously down-converts multiple channels sharing the cost of the key components over multiple channels and making it cost effective for multi-channel operation. The measurement range achieved with this method is equal to 4742 100ps nm for GVD, 200 4ps for DGD and 25 1dB for OSNR. To the knowledge of the author these dispersion monitoring ranges are the largest reported to date for the bit rate of 40Gbit/s with amplitude modulation formats. *An Algebraic Approach of Optical Performance Monitoring in All-optical Networks* Siu Ting Ho, 2005

Advanced Performance Monitoring in All-Optical Networks Yannis Benlachtar, 2010-09. This thesis investigates advanced optical performance monitoring approaches for future all-optical networks using the synchronous sampling technique. This allows for improved signal quality estimation, fault management and resource allocation through improved control of transmission at the physical layer level. Because of the increased transparency in next generation networks it is not possible to verify the quality of the signal at each node because of the limited number of optical-electrical-optical conversions and therefore new non-intrusive mechanisms to achieve signal quality monitoring are needed. The novel synchronous sampling technique can be deployed to estimate the bit error rate considered an important quality measure and hence can be utilised to certify service level agreements between operators and customers. This method also has fault identification capabilities by analysing the shapes of the obtained histograms. Each impairment affects the histogram in a specific way giving it a unique shape that can be used for root cause analysis. *Signal Processing Techniques for Optical Performance Monitoring in Dynamic Fiber-optic Networks* Faisal Nadeem Khan, Hong Kong Polytechnic University.
