Python for the same abstraction often confuses students new to computer science. Introduction to Programming Languages separates programming language concepts from the restraints of multiple language syntax by discussing the concepts at an abstract level. Designed for a one semester undergraduate course this classroom tested book teaches the principles of programming language design and implementation. It presents Common features of programming languages at an abstract level rather than a comparative level. The implementation model and behavior of programming paradigms at abstract levels so that students understand the power and limitations of programming paradigms. Language constructs at a paradigm level. A holistic view of programming language design and behavior. To make the book self contained the author introduces the necessary concepts of data structures and discrete structures from the perspective of programming language theory. The text covers classical topics such as syntax and semantics, imperative programming, program structures, information exchange between subprograms, object oriented programming, logic programming and functional programming. It also explores newer topics including dependency analysis, communicating sequential processes, concurrent programming constructs, web and multimedia programming, event based programming, agent based programming, synchronous languages, high productivity programming on massive parallel computers, models for mobile computing and much more. Along with problems and further reading in each chapter the book includes in depth examples and case studies using various languages that help students understand syntax in practical contexts.

Security in Computing Systems Joachim Biskup, 2008-11-14

This monograph on Security in Computing Systems: Challenges, Approaches and Solutions aims at introducing, surveying and assessing the fundamentals of security with respect to computing. Here computing refers to all activities which individuals or groups directly or indirectly perform by means of computing systems i.e. by means of computers and networks of them built on telecommunication. We all are such individuals whether enthusiastic or just bowed to the inevitable. So as part of the information society we are challenged to maintain our values to pursue our goals and to enforce our interests by consciously designing a global information infrastructure on a large scale as well as by appropriately configuring our personal computers on a small scale. As a result we hope to achieve secure computing. Roughly speaking computer assisted activities of individuals and computer mediated cooperation between individuals should happen as required.

by each party involved and nothing else which might be harmful to any party should occur The notion of security circumscribes many aspects ranging from human qua ties to technical enforcement First of all in considering the explicit security requirements of users administrators and other persons concerned we hope that usually all persons will follow the stated rules but we also have to face the pos bility that some persons might deviate from the wanted behavior whether accidentally or maliciously
