*Microgravity and Vision Impairments in Astronauts* Erik Seedhouse,2015-09-08 Recent missions on board the International Space Station have revealed previously unreported physiological consequences of long duration space flight particularly in eyesight and in this Brief Dr Seedhouse reviews the existing theories on what causes this degeneration and how long it will last Notably 60% of long duration crews have reported subjective degradation in vision a clear indication that further study is necessary before astronauts embark on even longer term space missions Decreased near visual acuity was reported in 46% of ISS Mir crewmembers resulting in a change of up to 2 dioptres in their refractive correction It is possible that ophthalmic changes have been present since the first days of spaceflight but had been attributed to other causes this approach to the issue as well as other hypotheses are all presented in full to give a broad foundation of the existing knowledge on the topic The changes have occurred at various times during a mission with varying degrees of visual degradation Some cases resolved on return to Earth but several crewmembers have not regained pre flight visual acuity indicating the damage may be permanent One explanation of the syndrome has been attributed to hyperopic shift due to aging but onboard analysis techniques including visual acuity assessments retinal imagery and ultrasound examination of the eye has led to the acceptance of a wider syndrome In addition to vision changes studies have reported flattening of the globe swelling of the optic disc papilledema choroidal folds in the retina swelling of the optic nerve sheath and visual field defects It is widely hypothesized that this spectrum of symptoms may be explained by an elevation of intracranial pressure ICP Establishing the provenance of this medical problem monitoring its occurrence and resolving the symptoms for future long term space missions is a key challenge for space medicine With this book readers have an entry point for understanding the full scope of the problem and its possible origins

**Microgravity Research and Development** Canadian Space Agency. User Development Program,1993 [Trailblazing Medicine](#) Erik Seedhouse,2011-05-06 Space medicine has been an important component of the success of human spaceflight and will continue to play a critical role in the future ventures To prepare for the day when astronauts will leave low Earth orbit for long duration exploration missions space medicine experts must develop a thorough understanding of the effects of microgravity on the human body as well as ways of mitigating these effects To gain a complete understanding of the effects of space on the human body and to create the tools and technologies required for successful exploration space medicine will become an increasingly collaborative discipline incorporating the skills of physicians biomedical scientists engineers and mission planners In this work Dr Erik Seedhouse examines the future of space medicine in relation to human space exploration He describes what is necessary to keep a crew alive in space how it will be accomplished in the future and the medical challenges faced by interplanetary astronauts The book is divided into three sections The first looks at space medicine on board the ISS where astronaut stays are often of long duration The second section considers the Exploration Class medical dangers beginning with radiation and the consequent Acute Radiation Syndrome ARS The final section looks at future developments and the importance of telemedicine and how revolutionary
