## **Microphone Array Signal Processing Springer Topics In Signal Processing:**

*Microphone Array Signal Processing* Jacob Benesty, Jingdong Chen, Yiteng Huang, 2008-03-11 In the past few years we have written and edited several books in the area of acoustic and speech signal processing. The reason behind this endeavor is that there were almost no books available in the literature when we first started while there was and still is a real need to publish manuscripts summarizing the most useful ideas, concepts, results and state of the art algorithms in this important area of research. According to all the feedback we have received so far we can say that we were right in doing this. Recently several other researchers have followed us in this journey and have published interesting books with their own visions and perspectives. The idea of writing a book on Microphone Array Signal Processing comes from discussions we have had with many colleagues and friends. As a consequence of these discussions we came up with the conclusion that again there is an urgent need for a monograph that carefully explains the theory and implementation of microphone arrays. While there are many manuscripts on antenna arrays from a narrowband perspective, narrowband signals and narrowband processing, the literature is quite scarce when it comes to speech arrays explained from a truly broadband perspective. Many algorithms for speech applications were simply borrowed from narrowband antenna arrays. However, a direct application of narrowband ideas to broadband speech processing may not be necessarily appropriate and can lead to many misunderstandings.

**Microphone Arrays** Michael Brandstein, Darren Ward, 2013-04-17 The study and implementation of microphone arrays originated over 20 years ago. Thanks to the research and experimental developments pursued to the present day, the field has matured to the point that array based technology now has immediate applicability to a number of current systems and a vast potential for the improvement of existing products and the creation of future devices. In putting this book together, our goal was to provide for the first time a single complete reference on microphone arrays. We invited the top researchers in the field to contribute articles addressing their specific topics of study. The reception we received from our colleagues was quite enthusiastic and very encouraging. There was the general consensus that a work of this kind was well overdue. The results provided in this collection cover the current state of the art in microphone array research, development and technological application. This text is organized into four sections which roughly follow the major areas of microphone array research today. Parts I and II are primarily theoretical in nature and emphasize the use of microphone arrays for speech enhancement and source localization, respectively. Part III presents a number of specific applications of array based technology. Part IV addresses some open questions and explores the future of the field.

**Speech and Audio Signal Processing** Ben Gold, Nelson Morgan, Dan Ellis, 2011-08-23 When *Speech and Audio Signal Processing* published in 1999 it stood out from its competition in its breadth of coverage and its accessible, intuition based style. This book was aimed at individual students and engineers excited about the broad span of audio processing and curious to understand the available techniques. Since then, with the advent of the iPod in 2001 the field of digital audio and music has exploded leading to a much greater interest in the

technical aspects of audio processing This Second Edition will update and revise the original book to augment it with new material describing both the enabling technologies of digital music distribution most significantly the MP3 and a range of exciting new research areas in automatic music content processing such as automatic transcription music similarity etc that have emerged in the past five years driven by the digital music revolution New chapter topics include Psychoacoustic Audio Coding describing MP3 and related audio coding schemes based on psychoacoustic masking of quantization noise Music Transcription including automatically deriving notes beats and chords from music signals Music Information Retrieval primarily focusing on audio based genre classification artist style identification and similarity estimation Audio Source Separation including multi microphone beamforming blind source separation and the perception inspired techniques usually referred to as Computational Auditory Scene Analysis CASA

### **Study and Design of Differential**

**Microphone Arrays** Jacob Benesty, Chen Jingdong, 2012-10-23 Microphone arrays have attracted a lot of interest over the last few decades since they have the potential to solve many important problems such as noise reduction, speech enhancement, source separation, dereverberation, spatial sound recording and source localization tracking to name a few. However, the design and implementation of microphone arrays with beamforming algorithms is not a trivial task when it comes to processing broadband signals such as speech. Indeed, in most sensor arrangements the beamformer output tends to have a frequency dependent response. One exception, perhaps, is the family of differential microphone arrays (DMAs) who have the promise to form frequency independent responses. Moreover, they have the potential to attain high directional gains with small and compact apertures. As a result, this type of microphone arrays has drawn much research and development attention recently. This book is intended to provide a systematic study of DMAs from a signal processing perspective. The primary objective is to develop a rigorous but yet simple theory for the design, implementation and performance analysis of DMAs. The theory includes some signal processing techniques for the design of commonly used first order, second order, third order and also the general  $N$ th order DMAs. For each order, particular examples are given on how to form standard directional patterns such as the dipole, cardioid, supercardioid, hypercardioid, subcardioid and quadrupole. The study demonstrates the performance of the different order DMAs in terms of beam pattern directivity factor, white noise gain and gain for point sources. The inherent relationship between differential processing and adaptive beamforming is discussed, which provides a better understanding of DMAs and why they can achieve high directional gain. Finally, we show how to design DMAs that can be robust against white noise amplification

### **Theory and Applications of Spherical Microphone Array Processing**

Daniel P. Jarrett, Emanuël A.P. Habets, Patrick A. Naylor, 2016-08-26 This book presents the signal processing algorithms that have been developed to process the signals acquired by a spherical microphone array. Spherical microphone arrays can be used to capture the sound field in three dimensions and have received significant interest from researchers and audio engineers. Algorithms for spherical array processing are different to corresponding algorithms already known in the literature of linear and planar arrays because the spherical geometry can be exploited to great beneficial effect. The authors aim to advance the field of spherical array processing by helping those new to the field to study it efficiently and from a single source as well as by offering a way for more experienced researchers and engineers to consolidate their understanding.

adding either or both of breadth and depth. The level of the presentation corresponds to graduate studies at MSc and PhD level. This book begins with a presentation of some of the essential mathematical and physical theory relevant to spherical microphone arrays and of an acoustic impulse response simulation method which can be used to comprehensively evaluate spherical array processing algorithms in reverberant environments. The chapter on acoustic parameter estimation describes the way in which useful descriptions of acoustic scenes can be parameterized and the signal processing algorithms that can be used to estimate the parameter values using spherical microphone arrays. Subsequent chapters exploit these parameters including in particular measures of direction of arrival and of diffuseness of a sound field. The array processing algorithms are then classified into two main classes each described in a separate chapter. These are signal dependent and signal independent beamforming algorithms. Although signal dependent beamforming algorithms are in theory able to provide better performance compared to the signal independent algorithms they are currently rarely used in practice. The main reason for this is that the statistical information required by these algorithms is difficult to estimate. In a subsequent chapter it is shown how the estimated acoustic parameters can be used in the design of signal dependent beamforming algorithms. This final step closes at least in part the gap between theory and practice.

### **Techniques for Noise**

**Robustness in Automatic Speech Recognition** Tuomas Virtanen, Rita Singh, Bhiksha Raj, 2012-09-19. Automatic speech recognition ASR systems are finding increasing use in everyday life. Many of the commonplace environments where the systems are used are noisy for example users calling up a voice search system from a busy cafeteria or a street. This can result in degraded speech recordings and adversely affect the performance of speech recognition systems. As the use of ASR systems increases knowledge of the state of the art in techniques to deal with such problems becomes critical to system and application engineers and researchers who work with or on ASR technologies. This book presents a comprehensive survey of the state of the art in techniques used to improve the robustness of speech recognition systems to these degrading external influences. Key features: Reviews all the main noise robust ASR approaches including signal separation, voice activity detection, robust feature extraction, model compensation and adaptation, missing data techniques and recognition of reverberant speech. Acts as a timely exposition of the topic in light of more widespread use in the future of ASR technology in challenging environments. Addresses robustness issues and signal degradation which are both key requirements for practitioners of ASR. Includes contributions from top ASR researchers from leading research units in the field.

Speech Processing in Modern Communication Israel Cohen, Jacob Benesty, Sharon Gannot, 2009-12-18 Modern communication devices such as mobile phones teleconferencing systems VoIP etc are often used in noisy and reverberant environments Therefore signals picked up by the microphones from telecommunication devices contain not only the desired near end speech signal but also interferences such as the background noise far end echoes produced by the loudspeaker and reverberations of the desired source These interferences degrade the fidelity and intelligibility of the near end speech in human to human telecommunications and decrease the performance of human to machine interfaces i e automatic speech recognition systems The proposed book deals with the fundamental challenges of speech processing in modern communication including speech enhancement interference suppression acoustic echo cancellation relative transfer function identification source localization dereverberation and beamforming in reverberant environments Enhancement of speech signals is necessary whenever the source signal is corrupted by noise In highly non stationary noise environments noise transients and interferences may be extremely annoying Acoustic echo cancellation is used to eliminate the acoustic coupling between the loudspeaker and the microphone of a communication device Identification of the relative transfer function between sensors in response to a desired speech signal enables to derive a reference noise signal for suppressing directional or coherent noise sources Source localization dereverberation and beamforming in reverberant environments further enable to increase the intelligibility of the near end speech signal Design of Circular Differential Microphone Arrays Jacob Benesty, Jingdong Chen, Israel Cohen, 2015-01-24 Recently we proposed a completely novel and efficient way to design differential beamforming algorithms for linear microphone arrays Thanks to this very flexible approach any order of differential arrays can be designed Moreover they can be made robust against white noise amplification which is the main inconvenience in these types of arrays The other well known problem with linear arrays is that electronic steering is not

really feasible In this book we extend all these fundamental ideas to circular microphone arrays and show that we can design small and compact differential arrays of any order that can be electronically steered in many different directions and offer a good degree of control of the white noise amplification problem high directional gain and frequency independent response We also present a number of practical examples demonstrating that differential beamforming with circular microphone arrays is likely one of the best candidates for applications involving speech enhancement i e noise reduction and dereverberation Nearly all of the material presented is new and will be of great interest to engineers students and researchers working with microphone arrays and their applications in all types of telecommunications security and surveillance contexts *The Journal of the Acoustical Society of America* Acoustical Society of America,2004

**Mathematical Reviews** ,2006 Deutsche Nationalbibliographie und Bibliographie der im Ausland erschienenen deutschsprachigen Veröffentlichungen ,2008 **Array Processing** Jacob Benesty,Israel Cohen,Jingdong Chen,2019-02-28 The focus of this book is on array processing and beamforming with Kronecker products It considers a large family of sensor arrays that allow the steering vector to be decomposed as a Kronecker product of two steering vectors of smaller virtual arrays Instead of directly designing a global beamformer for the original array once the steering vector has been decomposed smaller virtual beamformers are designed and separately optimized for each virtual array This means the matrices that need to be inverted are smaller which increases the robustness of the beamformers and reduces the size of the observations The book explains how to perform beamforming with Kronecker product filters using an unconventional approach It shows how the Kronecker product formulation can be used to derive fixed adaptive and differential beamformers with remarkable flexibility Furthermore it demonstrates how fixed and adaptive beamformers can be intelligently combined optimally exploiting the advantages of both The problem of spatiotemporal signal enhancement is also addressed and readers will learn how to perform Kronecker product filtering in this context **Speech Processing in Modern Communication** Israel Cohen,Jacob Benesty,Sharon Gannot,2010-02-04 Modern communication devices such as mobile phones teleconferencing systems VoIP etc are often used in noisy and reverberant environments Therefore signals picked up by the microphones from telecommunication devices contain not only the desired near end speech signal but also interferences such as the background noise far end echoes produced by the loudspeaker and reverberations of the desired source These interferences degrade the fidelity and intelligibility of the near end speech in human to human telecommunications and decrease the performance of human to machine interfaces i e automatic speech recognition systems The proposed book deals with the fundamental challenges of speech processing in modern communication including speech enhancement interference suppression acoustic echo cancellation relative transfer function identification source localization dereverberation and beamforming in reverberant environments Enhancement of speech signals is necessary whenever the source signal is corrupted by noise In highly non stationary noise environments noise transients and interferences may be extremely

annoying Acoustic echo cancellation is used to eliminate the acoustic coupling between the loudspeaker and the microphone of a communication device Identification of the relative transfer function between sensors in response to a desired speech signal enables to derive a reference noise signal for suppressing directional or coherent noise sources Source localization dereverberation and beamforming in reverberant environments further enable to increase the intelligibility of the near end speech signal
