**Modeling, Control and Optimization of Water Systems** Thomas Rauschenbach, 2015-12-14 This book provides essential background knowledge on the development of model based real world solutions in the field of control and decision making for water systems. It presents system engineering methods for modelling surface water and groundwater resources as well as water transportation systems rivers channels and pipelines. The models in turn provide information on both the water quantity flow rates water levels of surface water and groundwater and on water quality. In addition methods for modelling and predicting water demand are described. Sample applications of the models are presented such as a water allocation decision support system for semi arid regions a multiple criteria control model for run of river hydropower plants and a supply network simulation for public services
