

Cells and Energy

Study Guide B**Answer Key****SECTION 1: CHEMICAL ENERGY AND ATP**

- ATP is adenosine triphosphate (ADP).
- A molecule that transfers energy down the potential energy hill from molecules to cells processes.
- ATP is a high-energy molecule that is converted into lower-energy ADP when a phosphate group is removed and energy is released. ADP is converted back into ATP by the addition of a phosphate group.
- ATP is high-energy adenosine triphosphate (ATP). Phosphate removed, energy released; lower-energy adenosine triphosphate (ADP); energy released down potential energy hill carbon-based molecules, phosphate added.
- One molecule of glucose (sugars) yields about 38 ATP. A molecule of fat (fats) yields about 4000 ATP.
- Some plants get the energy in a plant's body by photosynthesis; yields about 1000 ATP. 30 calories per mg (70 Calories per gram).
- Some plants get the energy in a plant's body by respiration; yields about 100 ATP. 30 calories per mg (70 Calories per gram).
- A process by which some organisms use chemical energy released by light energy to store energy in carbon-based molecules.
- ATP has three phosphate groups; ADP has two phosphate groups.
- Together, they mean "put together with chemical aid." In photosynthesis, chemical energy is used to produce carbon-based molecules that store energy.

SECTION 2: OVERVIEW OF PHOTOSYNTHESIS

- They produce the source of chemical energy for plants and for other organisms.
- It captures light energy in light-susceptible chlorophyll molecules.
- It captures light energy in light-susceptible chlorophyll molecules that store energy.

Study Guide B

- A molecule in chlorophyll that absorbs some of the energy in visible light.
- Chlorophyll absorb wavelengths where photons enter leaves faster than in plants.
- Leaves and green.
- Leaf-shaped, membrane-bound compartments inside the green.
- $6\text{CO}_2 + 6\text{H}_2\text{O} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$
Carbon dioxide and water (the reactants) enter photosynthesis. Through many chemical reactions, with the help of many enzymes, a six-carbon sugar and oxygen (the products) are formed.
- The light-dependent reactions require light, and they store and transfer energy. The light-independent reactions do not directly need light, and they break sugars. **Light-dependent Reactions** (1) Energy from sunlight is absorbed and transferred along the light-based molecules. Water molecules are broken down and oxygen is released. (2) Energy stored along the light-based molecules is transferred to molecules that carry energy to the light-independent reactions. (3) Carbon dioxide is added to a cycle of chemical reactions, to break sugar molecules. (4) A six-carbon simple sugar (usually glucose; $\text{C}_6\text{H}_{12}\text{O}_6$) is formed.
- Energy from light is used to put sugars together.
- CH₂O energy is the light-absorbing molecule that makes leaves look green.
- The light-dependent reactions require sunlight, the light-independent reactions don't need sunlight.

SECTION 3: PHOTOSYNTHESIS IN DETAIL

- use light and transfer energy.
- groups of molecules that capture and transfer energy.

The Presence of the Past Rupert Sheldrake, 2012-03-26 Explains how self organizing systems from crystals to human societies share

collective memories that influence their form and behavior Includes new evidence and research in support of the theory of morphic resonance Explores the major role that morphic resonance plays not just in animal instincts and cultural inheritance but also in the larger process of evolution Shows that nature is not ruled by fixed laws but by habits and collective memories

In this fully revised and updated edition of The Presence of the Past Cambridge biologist Rupert Sheldrake lays out new evidence and research in support of his controversial theory of morphic resonance and explores its far reaching implications in the fields of biology chemistry physics psychology and sociology His theory proposes that all self organizing systems from crystals to human society inherit a collective memory that influences their form and behavior This collective memory works

through morphic fields which organize the bodies of plants and animals coordinate the activities of brains and underlie conscious mental activity Sheldrake shows how all human beings draw upon and contribute to a collective human memory and that even our individual recollections depend on morphic resonance rather than physical storage in the brain He

explores the major role that morphic resonance plays not just in animal instincts and cultural inheritance such as religion and ritual but also in the larger process of evolution which Sheldrake shows to be more an interplay of habit and creativity than a mere survival of the fittest Offering a replacement for the outdated mechanistic worldview that has dominated biology since the nineteenth century Sheldrake's new understanding of life matter and mind shows that rather than being ruled by fixed laws nature is essentially habitual And because memory is inherent in nature he explains in order to survive successfully for
