Model Predictive Control Stochastic Processing:

Model Predictive Control Basil Kouvaritakis, Mark Cannon, 2015-12-01 For the first time a textbook that brings together classical predictive control with treatment of up to date robust and stochastic techniques Model Predictive Control describes the development of tractable algorithms for uncertain stochastic constrained systems The starting point is classical predictive control and the appropriate formulation of performance objectives and constraints to provide guarantees of closed loop stability and performance Moving on to robust predictive control the text explains how similar guarantees may be obtained for cases in which the model describing the system dynamics is subject to additive disturbances and parametric uncertainties Open and closed loop optimization are considered and the state of the art in computationally tractable methods based on uncertainty tubes presented for systems with additive model uncertainty Finally the tube framework is also applied to model predictive control problems involving hard or probabilistic constraints for the cases of multiplicative and stochastic model uncertainty The book provides extensive use of illustrative examples sample problems and discussion of novel control applications such as resource allocation for sustainable development and turbine blade control for maximized power capture with simultaneously reduced risk of turbulence induced damage Graduate students pursuing courses in model predictive control or more generally in advanced or process control and senior undergraduates in need of a specialized treatment will find Model Predictive Control an invaluable guide to the state of the art in this important subject For the instructor it provides an authoritative resource for the construction of courses

Model Predictive Control in the Process Industry Eduardo F Camacho, Carlos A Bordons, 1995-03-17 **Model Predictive Control** Eduardo F. Camacho, Carlos Bordons Alba, 2013-01-10 The second edition of Model Predictive Control provides a thorough introduction to theoretical and practical aspects of the most commonly used MPC strategies It bridges the gap between the powerful but often abstract techniques of control researchers and the more empirical approach of practitioners The book demonstrates that a powerful technique does not always require complex control algorithms Many new exercises and examples have also been added throughout Solutions available for download from the authors website save the tutor time and enable the student to follow results more closely even when the tutor isn't present

Robust Model Predictive Control for Large-Scale Manufacturing Systems subject to Uncertainties Jens Tonne, 2018-01-19 Large scale manufacturing systems are often run with constant process parameters although continuous and abrupt disturbances influence the process To reduce quality variations and scrap a closed loop control of the process variables becomes indispensable In this thesis a modeling and control framework for multistage manufacturing systems is developed in which the systems are subject to abrupt faults such as component defects and continuous disturbances In this context three main topics are considered the development of a modeling framework the design of robust distributed controllers and the application of both to the models of a real hot stamping line The focus of all topics is on the control of the product properties considering the available knowledge of faults and disturbances

Nonlinear Model Predictive Control Lalo Magni, Davide Martino Raimondo, Frank Allgöwer, 2009-05-25 Over the past few years significant progress has been achieved in the field of nonlinear model predictive control NMPC also referred to as receding horizon control or moving horizon control More than 250 papers have been published in 2006 in ISI Journals With this book we want to bring together the contributions of a diverse group of internationally well recognized researchers and industrial practitioners to critically assess the current status of the NMPC field and to discuss future directions and needs The book consists of selected papers presented at the International Workshop on Assessment and Future Directions of Nonlinear Model Predictive Control that took place from September 5 to 9 2008 in Pavia Italy **Model Predictive Control in the Process Industry** Eduardo F. Camacho, Carlos A. Bordons, 2012-12-06 Model Predictive Control is an important technique used in the process control industries It has developed considerably in the last few years because it is the most general way of posing the process control problem in the time domain The Model Predictive Control formulation integrates optimal control stochastic control control of processes with dead time multivariable control and future references The finite control horizon makes it possible to handle constraints and non linear processes in general which are frequently found in industry Focusing on implementation issues for Model Predictive Controllers in industry it fills the gap between the empirical way practitioners use control algorithms and the sometimes abstractly formulated techniques developed by researchers The text is firmly based on material from lectures given to senior undergraduate and graduate students and articles written by the authors **Data Driven Strategies** Wang Jianhong, Ricardo A. Ramirez-Mendoza, Ruben Morales-Menendez, 2023-03-31 A key challenge in science and engineering is to provide a quantitative description of the systems under investigation leveraging the noisy data collected Such a description may be a complete mathematical model or a mechanism to return controllers corresponding to new unseen inputs Recent advances in the theories are described in detail along with their applications in engineering The book aims to develop model free system analysis and control strategies i e data driven control from theoretical analysis and engineering applications based only on measured data The study aims to develop system identification and combination in advanced control theory i e data driven control strategy as system and controller are generated from measured data directly The book reviews the development of system identification and its combination in advanced control theory i e data driven control strategy as they all depend on measured data Firstly data driven identification is developed for the closed loop nonlinear system and model validation i e obtaining model descriptions from measured data Secondly the data driven idea is combined with some control strategies to be considered data driven control strategies such as data driven model predictive control data driven iterative tuning control and data driven subspace predictive control Thirdly data driven identification and data driven control strategies are applied to interested engineering In this context the book provides algorithms to perform state estimation of dynamical systems from noisy data and some convex optimization algorithms through identification and control problems Advances in Process Control with Real

Fast Stochastic Model Predictive Control Under Parametric Uncertainties Matthias Freiherr von Andrian-Werburg, 2020. Model predictive control (MPC) is widely applied in industry due to its ability to handle constraints explicitly. Many processes in chemical engineering have a high number of states but a relatively low number of inputs and outputs. Input-output formulations of MPC employ process models predicting outputs directly from input data and thus avoiding the higher computational complexity of state space models, resulting in fast MPC. Model uncertainties are ubiquitous, and there are two popular approaches to incorporate them in the MPC framework. In robust MPC, the worst case of the uncertainty is optimized, which can result in sluggish performance because this case often has a very low probability of occurrence. Stochastic MPC, on the other hand, incorporates information of the probability distribution of the uncertainty, which allows the optimization based on the probability of occurrence. The main focus of this thesis is on fast stochastic input-output formulations of MPC. Polynomial Chaos Theory is used to incorporate probability distributions of uncertainties into process models. This approach avoids the need for sampling and makes on-line model evaluations possible. Fast stochastic MPC algorithms are presented that address probabilistic uncertainties while having no steady-state offset. One method of applying Polynomial Chaos Theory to process models is Galerkin projection, which requires the manipulation of model equations. A fully automated implementation based on symbolic arithmetic is presented to perform these manipulations. By introducing output feedback control, it is shown that the fast stochastic MPC can be used to control unstable systems. The thesis also shows the applicability of linear input-output formulations of MPC to control a highly integrated nonlinear continuous crystallization process.

Computation in Constrained Stochastic Model Predictive Control of Linear Systems Minyong Shin, 2011 Despite its sub optimality Model Predictive Control MPC has received much attention over the recent decades due to its ability to handle constraints In particular stochastic MPC which includes uncertainty in the system dynamics is one of the most active recent research topics in MPC In this dissertation we focus on 1 increasing computation speed of constrained stochastic MPC of linear systems with additive noise and 2 improving the accuracy of an approximate solution involving systems with additive and multiplicative noise Constrained MPC for linear systems with additive noise has been successfully formulated as a semidefinite programming problem SDP using the Youla parameterization or innovation feedback and linear matrix inequalities Unfortunately this method can be prohibitively slow even for problems with moderate size state Thus in this thesis we develop an interior point algorithm which can more efficiently solve the problem This algorithm converts the stochastic problem into a deterministic one using the mean and the covariance matrix as the system state and using affine feedback A line search interior point method is then directly applied to the nonlinear deterministic optimization problem In the process we take advantage of a recursive structure that appears when a control problem is solved via the line search interior point method in order to decrease the algorithmic complexity of the solution We compare the computation time and complexity of our algorithm against an SDP solver The second part of the dissertation deals with systems with additive and multiplicative noise under probabilistic constraints This class of systems differs from the additive noise case in that the probability distribution of a state is neither Gaussian nor known in closed form This causes a problem when the probability constraints are dealt with In previous studies this problem has been tackled by approximating the state as a Gaussian random variable or by approximating the probability bound as an ellipsoid In this dissertation we use the Cornish Fisher expansion to approximate the probability bounds of the constraints Since the Cornish Fisher expansion utilizes quantile values with the first several moments the probabilistic constraints have the same form as those in the additive noise case when the constraints are converted to deterministic ones This makes the procedure smooth when we apply the developed algorithm to a linear system with multiplicative noise Moreover we can easily extend the application of the algorithm to a linear system with additive plus multiplicative noise
