cost of satisfying a set of demands customers with respect to a set of constraints This book deals with location problems It considers the relationship between location problems and other areas such as supply chains

Network and Discrete Location Mark S. Daskin, 2011-02-14 The comprehensive introduction to the art and science of locating facilities to make your organization more efficient effective and profitable For the professional siting facilities the task of translating organizational goals and objectives into concrete facilities requires a working familiarity with the theoretical and practical fundamentals of facility location planning and modeling The first hands on guide to using and developing facility location models Network and Discrete Location offers a practiceoriented introduction to model building methods and solution algorithms complete with software to solve classical problems of realistic size and end of chapter exercises to enhance the reader's understanding The text introduces the reader to the key classical location problems covering center median and fixed charge which form the nucleus of facility location modeling It also discusses real life extensions of the basic models used in locating production and distribution facilities interacting services and facilities and undesirable facilities The book outlines a host of methodological tools for solving location models and provides insights into when each approach is useful and what information it provides Designed to give readers a working familiarity with the basic facility location model types as well as an intuitive knowledge of the uses and limits of modeling techniques Network and Discrete Location brings students and professionals alike swiftly from basic theory to technical fluency

Facility Location Zvi Drezner, 2011-12-07 Facility location applications are concerned with the location of one or more facilities in a way that optimizes a certain objective such as minimizing transportation cost providing equitable service to customers capturing the largest market share etc Facility location problems give rise to challenging geometrical and combinatorial problems The research on facility location problems spans many research fields such as operations research management science industrial engineering geography economics computer science mathematics marketing electrical engineering urban planning and related fields Applications to facility location models abound Location of warehouses plants hospitals retail outlets are classical examples Applications are also found in the location of electronic components warning sirens sprinklers radar

beams exploratory oil wells These are less obvious facilities One should consider applying a location model to any scenario that involves finding a best location or locations for any object s This book Facility Location A Survey of Applications and Methods provides a state of the art review along with references to important contemporary topics in locational analysis The book includes twenty chapters divided into four parts each dealing with a different aspect of location modeling and implementation The book concludes with over 1 200 references The first part Methodology and Analysis consists of a survey of methodological and technical aspects of location analysis Issues such as estimating distances the error introduced by assuming discrete demand rather than continuous one global optimization techniques inference of weights conjugate duality and using Voronoi diagrams are reviewed Facility Location Under Uncertainty Francisco Saldanha-da-Gama, Shuming Wang, 2024-06-03 This textbook provides researchers post graduate students and practitioners with a systematic framework for coping with uncertainty when making facility location decisions In addition to in depth coverage of models and solution techniques application areas are discussed The book guides readers through the field showing how to successfully analyze new problems and handle new applications Initially the focus is on base models and concepts Then gradually more comprehensive models and more involved solution algorithms are discussed Throughout the book two perspectives are intertwined the paradigm for capturing uncertainty and the facility location problem at hand The former includes stochastic programming robust optimization chance constrained programming and distributional robust optimization the latter includes classical facility location problems and those arising in many real world applications such as hub location location routing and location inventory Facility Location Zvi Drezner, Horst W. Hamacher, 2004-05-03 The book covers both theory and applications of locational analysis LocAn The reader will see the power of LocAn models in various real world contexts varying from communication design to robotics and mail delivery It is divided into two parts The first part contains an overview of some of the LocAn methodologies The second part describes in thorough detail some selected applications The text provides researchers with an excellent and well thought out review of available location models **Single-Facility Location Problems with Barriers** Kathrin Klamroth, 2002-10-17 This text develops the mathematical implications of barriers to the geometrical and analytical characteristics of continuous location problems The book will appeal to those working in operations research and management science and mathematicians interested in optimization theory and its applications Equilibrium Facility Location on Networks Tan C. Miller, Terry L. Friesz, Roger L. Tobin, 1995-12-12 This is a book about the simultaneous location production and distribution decisions of a firm entering a competitive market whose spatial nature is describable by a network in which the market either achieves an equilibrium or is equilibrium tending As such the problem is of clear theoretical and practical importance for it is a rather general version of the problem faced by real firms every day in deciding where to locate Further the timeliness of this subject manifests itself in the growing excitement and interest found both in the research academic communities and in the practitioner private industry

communities for more comprehensive approaches to competitive facility location analysis and equilibrium modeling of networks. The desire both for new conceptual approaches yielding enhanced insights and for practical methodologies to capture these insights drives this interest. While normative deterministic facility location modeling techniques currently provide valuable input into the location decision making process, researchers and practitioners alike have realized the vast and relatively untapped potential of more advanced location decision making techniques. In this book we develop what we believe represents a major new line of research in the field of competitive facility location analysis, namely equilibrium facility location modeling. In particular, this book offers a number of innovations in the mathematical analysis and computation of solutions to location models which we have pioneered and which are collected under a single cover for the first time. The Obnoxious Competitive Facility Location Model Z. Drezner, T. Drezner, Dawit Zerom, 2022. In this paper we propose a new competitive location model that considers the possible negative impact generated by competing facilities such as cannabis dispensaries on surrounding communities. The facilities cannot be located too close to the communities. Therefore, when distances are Euclidean, the facilities must be located at a point outside a set of circles centered at the communities. After formulating the model, a specially designed efficient algorithm that solves the single facility location problem within a given relative accuracy of optimality is constructed. A total of 128 instances are solved in a relatively short time. The largest instance of 10 existing competing facilities and 20,000 demand points was solved in less than 15 minutes of computer time. This new model opens avenues for future research by designing similar new models. Also, the algorithm designed in this paper can be applied to solving other location problems with outside of a set of circles constraints. **Facility Layout** Miguel F. Anjos, Manuel V.C. Vieira, 2021-04-24. This book presents a structured approach to develop mathematical optimization formulations for several variants of facility layout. The range of layout problems covered includes row layouts, floor layouts, multi-floor layouts, and dynamic layouts. The optimization techniques used to formulate the problems are primarily mixed integer linear programming, second order conic programming, and semidefinite programming. The book also covers important practical considerations for solving the formulations. The breadth of approaches presented helps the reader to learn how to formulate a variety of problems using mathematical optimization techniques. The book also illustrates the use of layout formulations in selected engineering applications, including manufacturing, building design, automotive, and hospital layout.

Multicriteria Location Analysis H. A. Eiselt, Vladimir Marianov, Joyendu Bhadury, 2023-03-01. This book applies Multicriteria Decision Making (MCDM) tools and techniques to problems in location analysis. It begins with a generic model for MCDM and subsequently develops specific versions of the technique for particular location problems. Throughout the book, MCDM is understood to encompass all tools and techniques that choose or rank existing or feasible solutions, including discrete multi-attribute decision making (MADM) problems which typically include an attribute table that specifies the consequences of each decision with regard to the given criteria, as well as multi-objective linear problems (MOLPs) which

incorporate all objectives in a single optimization problem The book is organized as follows the first four chapters introduce readers to the basic tools and techniques used in single objective optimization multicriteria decision making location analysis and other tools such as statistical regression and geographical information systems This is followed by ten chapters on model applications each of which introduces readers to a specific location problem and applies one technique to solve it The book is then wrapped up in a closing chapter that looks at the location process from a practitioner s point of view This book is intended as a textbook for upper undergraduate and master level courses on location analysis It will also benefit decision makers who actually need to locate facilities

An Approximation Algorithm for a Competitive Facility Location Problem with Network Effects Ling-Chieh Kung, Wei-Hung Liao, 2018

When facilities are built to serve end consumers directly it is natural that consumer demands are affected by the number of open facilities Moreover sometimes a facility becomes more attractive if other facilities around it are built To capture these factors in this study we construct a discrete location model for profit maximization with endogenous consumer demands and network effects The effective demand is then a concave function of the sum of benefits of open facilities due to the diminishing marginal benefit effect When the function is linear we design a polynomial time algorithm to find an optimal solution When it is nonlinear we show that the problem is NP hard and develop an approximation algorithm based on demand function approximation linear relaxation decomposition and sorting It is demonstrated that the proposed algorithm has worst case performance guarantees for some special cases of our problem Numerical studies are conducted to demonstrate the average performance and general applicability of our algorithms
