## **Open Quantum Systems An Introduction Springerbriefs In Physics:**

**Open Quantum Systems** Ángel Rivas, Susana F. Huelga, 2011-10-01 In this volume the fundamental theory of open quantum systems is revised in the light of modern developments in the field. A unified approach to the quantum evolution of open systems is presented by merging concepts and methods traditionally employed by different communities such as quantum optics, condensed matter, chemical physics and mathematical physics. The mathematical structure and the general properties of the dynamical maps underlying open system dynamics are explained in detail. The microscopic derivation of dynamical equations including both Markovian and non Markovian evolutions is also discussed. Because of the step by step explanations this work is a useful reference to novices in this field. However experienced researchers can also benefit from the presentation of recent results.

**Open Quantum Systems** Dorothea Bahns, Anke Pohl, Ingo Witt, 2019-06-28 This book presents four survey articles on various aspects of open quantum systems specifically addressing quantum Markovian processes, Feller semigroups and nonequilibrium dynamics. The contributions are based on lectures given by distinguished experts at a summer school in Göttingen, Germany. Starting from basic notions the authors of these lecture notes accompany the reader on a journey up to the latest research highlighting new challenges and addressing unsolved problems at the interface between mathematics and physics. Though the book is primarily addressed to graduate students it will also be of interest to researchers.

**Dynamics, Information and Complexity in Quantum Systems** Fabio Benatti, 2023-08-22 This second edition of Dynamics, Information and Complexity in Quantum Systems widens its scope by focussing more on the dynamics of quantum correlations and information in microscopic and mesoscopic systems and their use for metrological and machine learning purposes. The book is divided into three parts: Part One Classical Dynamical Systems. Addresses classical dynamical systems, classical dynamical entropy and classical algorithmic complexity. Includes a survey of the theory of simple perceptrons and their storage capacity. Part Two Quantum Dynamical Systems. Focuses on the dynamics of entanglement under dissipative dynamics and its metrological use in finite level quantum systems. Discusses the quantum fluctuation approach to large scale mesoscopic systems and their emergent dynamics in quantum systems with infinitely many degrees of freedom. Introduces a model of quantum perceptron whose storage capacity is computed and compared with the classical one. Part Three Quantum Dynamical Entropies and Complexities. Devoted to quantum dynamical entropies and algorithmic complexities. This book is meant for advanced students, young and senior researchers working in the fields of quantum statistical mechanics, quantum information and quantum dynamical systems. It is self contained and the only prerequisites needed are a standard knowledge of statistical mechanics, quantum mechanics and linear operators on Hilbert spaces.

bridging the gap between microscopic and macroscopic modeling approaches The central result is a novel hybrid quantum classical model system that self consistently couples semi classical carrier transport theory with open quantum many body systems This allows for a comprehensive description of quantum light emitting diodes on multiple scales It enables the calculation of the quantum optical figures of merit together with the simulation of the spatially resolved current flow in complex multi dimensional semiconductor device geometries out of one box The hybrid system is shown to be consistent with fundamental laws of non equilibrium thermodynamics and is demonstrated by numerical simulations of realistic devices

**Environment** Martin J. A. Schütz,2016-11-15 This thesis offers a comprehensive introduction to surface acoustic waves in the quantum regime It addresses two of the most significant technological challenges in developing a scalable quantum information processor based on spins in quantum dots i decoherence of the electronic spin qubit due to the surrounding nuclear spin bath and ii long range spin spin coupling between remote qubits Electron spins confined in quantum dots QDs are among the leading contenders for implementing quantum information processing To this end the author pursues novel strategies that turn the unavoidable coupling to the solid state environment in particular nuclear spins and phonons into a valuable asset rather than a liability
