## Overview of OpenWrt BuildRoot Environment

OpenWrt Buildroot environment is a collection of Makefiles, patches and scripts, which generates the cross-compilation toolchain, downloads Linux kernel, generates a root file system, manages 3<sup>rd</sup> party packages, etc. The cross-compilation toolchain uses uClibc. With OpenWrt Buildroot, developers can compile the custom firmware image for supported hardware / architectures. Please NOTE that in the OpenWrt Buildroot source tree, there is no Linux kernel or any source code tarballs of the 3<sup>rd</sup> party packages. The collection of Makefiles determines the version of Linux kernel to download, and the version of the package tarball to download and compiled in to the image. Figure 1 shows the structure of the OpenWrt Buildroot source tree.

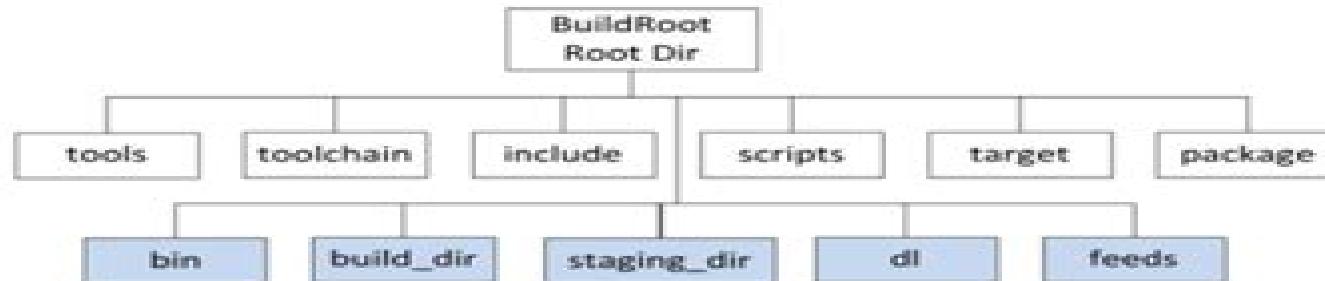

Figure 1. OpenWrt Buildroot Source Tree (The folders in the second lines are generated during compilation).

- **tools** – contains all the build instructions to fetch the image building tools
- **toolchain** – contains all the build instructions to fetch the kernel headers, the C library, the bin-utils, the compiler itself and the debugger. If you add a completely new architecture, you would add a configuration for the C library here.
- **target** - build instruction for firmware image generating process and for the kernel building process; compiles kernel and firmware image utilities, builds firmware image, generate Image Generator (former called Image Builder)
- **package** – the OpenWrt Makefiles and patches for all the main packages. The OpenWrt Makefile has its own syntax, different from the conventional Makefile of Linux make tool.
