**Developing Multi-Tenant Applications for the Cloud on Windows Azure** Dominic Betts,Alex Homer,Alejandro Jezierski,2013-03 How can you create an application that has truly global reach and can scale rapidly to meet sudden massive spikes in demand Historically companies had to invest in an infrastructure capable of

supporting such an application themselves and plan for peak demand which often means that much of the capacity sits idle for much of the time Typically only large companies would have the available resources to risk such an enterprise The cloud has changed the rules of the game By making infrastructure available on a pay as you go basis creating a massively scalable global application is within the reach of both large and small companies Yes by moving applications to the cloud you're giving up some control and autonomy but you're also going to benefit from reduced costs increased flexibility and scalable computation and storage This guide is the third release of the second volume in a series about Windows Azure It demonstrates how you can create from scratch a multi tenant Software as a Service SaaS application to run in the cloud by using the Windows Azure tools and the increasing range of capabilities of Windows Azure The guide focuses on both good practice design and the practicalities of implementation for multi tenant applications but also contains a wealth of information on factors such as security scalability availability and elasticity that are relevant to all types of cloud hosted applications The guide is intended for any architect developer or information technology IT professional who designs builds or operates applications and services that run on or interact with the cloud Although applications do not need to be based on the Windows operating system to work in Windows Azure or be written using a .NET language this guide is written for people who work with Windows based systems You should be familiar with the .NET Framework Visual Studio ASP.NET MVC and Visual C#

## **MOVING APPLICATIONS TO THE CLOUD ON THE MICROSOFT WINDOWS AZURE PLATFORM (With CD )** Dominic Betts,Scott Densmore,Ryan Dunn,Masashi

Narumoto,Eugenio Pace,2011-07-01 About The Book How can a company s applications be scalable and have high availability To achieve this along with developing the applications you must also have an infrastructure that can support them For example you may need to add servers or increase the capacities of existing ones have redundant hardware add logic to the application to handle distributed computing and add logic for failovers You have to do this even if an application is in high demand for only short periods of time Life becomes even more complicated and expensive when you start to consider issues such as network latency and security boundaries The cloud offers a solution to this dilemma The cloud is made up of interconnected servers located in various data centers However you see what appears to be a centralized location that someone else hosts and manages By shifting the responsibility of maintaining an infrastructure to someone else you re free to concentrate on what matters most the application If the cloud has data centers in different geographical areas you can move your content closer to the people who are using it most If an application is heavily used in Asia have an instance running in a

data center located there This kind of flexibility may not be available to you if you have to own all the hardware Another advantage to the cloud is that it's a pay as you go proposition If you don't need it you don't have to pay for it When demand is high you can scale up and when demand is low you can scale back Yes by moving applications to the cloud you're giving up some control and autonomy but you're also going to benefit from reduced costs increased flexibility and scalable computation and storage The Windows Azure Architecture Guide shows you how to do this **Pro WF 4.5** Bayer White,2013-04-10 In Pro WF 4.5 you'll find the insight and direction for understanding how to build workflows using WF 4.5 and host them as long running services using Microsoft's Windows Server for on-premises work and Azure AppFabric for hosting workflows in the cloud With the concept of cloud computing using Windows Azure and the maturity of Windows Server technology workflow services can be hosted with first-class service monitoring with less overhead from a developer's perspective Building workflows in a declarative fashion and hosting them as services is a natural way for building business logic that is tiered away from running applications that subscribe to them therefore providing flexibility for when business processes change In Pro WF 4.5 author Bayer White walks you as the developer through the steps and explains the concepts of declaratively modeling domain specific business processes that can be hosted and exposed as services either on-premises or as cloud services within Windows Azure Gives you a practical knowledge of WF 4.5 Windows Server and Azure AppFabric Builds a foundation for building workflows that can be exposed on-premises or in the cloud Shows how to use the tools available for managing workflow services **MSDN Magazine** ,2009-07 **C# Algorithms for New Programmers: A Practical Guide with Examples** William E.
