**PETSc for Partial Differential Equations: Numerical Solutions in C and Python** Ed Bueler, 2020-10-22 The Portable Extensible Toolkit for Scientific Computation PETSc is an open source library of advanced data structures and methods for solving linear and nonlinear equations and for managing discretizations. This book uses these modern numerical tools to demonstrate how to solve nonlinear partial differential equations (PDEs) in parallel. It starts from key mathematical concepts such as Krylov space methods, preconditioning, multigrid, and Newton's method. In PETSc, these components are composed at run time into fast solvers. Discretizations are introduced from the beginning with an emphasis on finite difference and finite element methodologies. The example C programs of the first 12 chapters listed on the inside front cover solve mostly elliptic and parabolic PDE problems. Discretization leads to large sparse and generally nonlinear systems of algebraic equations. For such problems, mathematical solver concepts are explained and illustrated through the examples with sufficient context to speed further development. PETSc for Partial Differential Equations addresses both discretizations and fast solvers for PDEs, emphasizing practice more than theory. Well-structured examples lead to run time choices that result in high solver performance and parallel scalability. The last two chapters build on the reader's understanding of fast solver concepts when applying the Firedrake Python finite element solver library. This textbook, the first to cover PETSc programming for nonlinear PDEs, provides an on-ramp for graduate students and researchers to a major area of high performance computing for science and engineering. It is suitable as a supplement for courses in scientific computing or numerical methods for differential equations.

**Statistical Image Processing and Multidimensional Modeling** Paul Fieguth, 2010-10-17 Images are all around us. The proliferation of low cost high quality imaging devices has led to an explosion in acquired images. When these images are acquired from a microscope, telescope, satellite, or medical imaging device, there is a statistical image processing task: the inference of something (an artery, a road, a DNA marker, an oil spill) from imagery, possibly noisy, blurry, or incomplete. A great many textbooks have been written on image processing. However, this book does not so much focus on images per se but rather on spatial data sets with one or more measurements taken over a two- or higher-dimensional space and to which standard image processing algorithms may not apply. There are many important data analysis methods developed in this text for such statistical image problems. Examples abound throughout: remote sensing, satellite data mapping, data assimilation, climate change studies, land use, medical imaging, organ segmentation, anomaly detection, computer vision, image classification, segmentation, and other 2D/3D problems, biological imaging, porous media. The goal then of this text is to address methods for solving multidimensional statistical problems. The text strikes a balance between mathematics and theory on the one hand versus applications and algorithms on the other, by deliberately developing the basic theory (Part I), the mathematical modeling (Part II), and the algorithmic and numerical methods (Part III) of solving a given problem. The particular emphases of the book include inverse problems, multidimensional modeling,

random fields and hierarchical methods
