Microelectronics Packaging Handbook:

Microelectronics Packaging Handbook Rao Tummala, Eugene J. Rymaszewski, Alan G. Klopfenstein, 1997-01-31 Provides the advances in microelectronics design methods modeling tools simulation techniques and manufacturing procedures. This book discusses packages that meet the power, cooling, protection and interconnection requirements of increasingly dense and fast microcircuitry. Microelectronics Packaging Handbook Rao Tummala, Eugene J. Rymaszewski, Alan G.

Klopfenstein, 1997-01-31 This thoroughly revised and updated three volume set continues to be the standard reference in the field providing the latest in microelectronics design methods modeling tools simulation techniques and manufacturing procedures. Unlike reference books that focus only on a few aspects of microelectronics packaging these outstanding volumes discuss state of the art packages that meet the power, cooling, protection and interconnection requirements of increasingly dense and fast microcircuitry. Providing an excellent balance of theory and practical applications this dynamic compilation features step by step examples and vital technical data simplifying each phase of package design and production. In addition the volumes contain over 2000 references, 900 figures and 250 tables. Part I Technology Drivers covers the driving force of microelectronics packaging electrical, thermal and reliability. It introduces the technology developer to aspects of manufacturing that must be considered during product development. Part II Semiconductor Packaging discusses the interconnection of the IC chip to the first level of packaging and all first level packages. Electrical, test, sealing and encapsulation technologies are also covered in detail. Part III Subsystem Packaging explores board level packaging as well as connectors, cables and optical packaging. Electronics has become the largest industry surpassing agriculture, auto and heavy metal industries. It has become the industry of choice for a country to prosper already having given rise to the phenomenal prosperity of Japan, Korea, Singapore, Hong Kong and Ireland among others. At the current growth rate total worldwide semiconductor sales will reach 300B by the year 2000. The key electronic technologies responsible for the growth of the industry include semiconductors, the packaging of semiconductors for systems use in auto, telecom, computer, consumer, aerospace and medical industries, displays, magnetic and optical storage as well as software and system technologies. There has been a paradigm shift however in these technologies from mainframe and supercomputer applications at any cost to consumer applications at approximately one tenth the cost and size. Personal computers are a good example going from 500IMIP when products were first introduced in 1981 to a projected 11IMIP within 10 years. Thin, light, portable, user friendly and very low cost are therefore the attributes of tomorrow's computing and communications systems. Electronic packaging is defined as interconnection, powering, cooling and protecting semiconductor chips for reliable systems. It is a key enabling technology achieving the requirements for
