Advanced Computational Approaches for Water Treatment Krunal M Gangawane, Madhuresh

Dwivedi, Praveen Ghodke, 2023-10-06 A rapid growth in global industrialization and population has triggered intense environmental pollution that has led to a water crisis resulting in the decay in the quality of human life and economic losses. Novel water purification techniques are expected to alleviate this challenge. Recently various water purification techniques along with different computational techniques have been developed. For instance water purification techniques such as electromagnetic water purification, solute surface interactions in water, use of micro magnetofluidic devices, UV led water purification and use of membranes can be thoroughly investigated by using a range of computation techniques such as molecular dynamics, the lattice Boltzmann method and the Navier Stokes method based solver. **Advanced Computational Approaches for Water Treatment Applications in Food and Chemical Engineering** presents these different numerical techniques and traditional modeling and simulation approaches to elaborate on and explain the various water purification techniques. Features Serves as a dedicated reference for this emerging topic. Discusses state of the art developments in advanced computational techniques for water purification. Brings together diverse experience in this field in one reference text. Provides a roadmap for future developments in the area. This book is primarily intended for chemical engineers, hydrologists, water resource managers, civil engineers, environmental engineers, food scientists, and food engineers interested in understanding the numerical approaches for different water purification techniques such as membrane sedimentation, filtration, micromagnetofluidic device and ozone, UV among others

Computational Aerodynamic Modeling of

Aerospace Vehicles Mehdi Ghoreyshi, Karl Jenkins, 2019-03-08 Currently the use of computational fluid dynamics (CFD) solutions is considered as the state of the art in the modeling of unsteady nonlinear flow physics and offers an early and improved understanding of air vehicle aerodynamics and stability and control characteristics. This Special Issue covers recent computational efforts on simulation of aerospace vehicles including fighter aircraft, rotorcraft, propeller driven vehicles, unmanned vehicle projectiles and air drop configurations. The complex flow physics of these configurations pose significant challenges in CFD modeling. Some of these challenges include prediction of vortical flows and shock waves, rapid maneuvering aircraft with fast moving control surfaces and interactions between propellers and wing, fluid and structure, boundary layer and shock waves. Additional topics of interest in this Special Issue is the use of CFD tools in aircraft design and flight mechanics. The problem with these applications is the computational cost involved particularly if this is viewed as a brute force calculation of vehicle's aerodynamics through its flight envelope. To make progress in routinely using of CFD in aircraft design methods based on sampling, model updating and system identification should be considered
