*Alternative Splicing in Brain Function* Kif Liakath-Ali,Matthias Soller,2023-12-13 Functional and structural intricacies of biological systems emerge from the complex nature of the genome A key aspect of genome complexity can be attributed to the process of alternative splicing of precursor mRNA or pre mRNA during which introns are removed and exons are selectively spliced together This highly regulated process generates different mature mRNA transcripts from a single gene and is widespread throughout the eukaryotic evolution The majority of the genes expressed in the mammalian central nervous system undergo extensive alternative splicing Some genes can generate more than a thousand isoforms resulting in diverse proteoforms that can differ in their function binding preference catalytic activity and localization Perturbation in alternative splicing has been linked to many neurological disorders Despite its significance we still lack a comprehensive understanding of its role in neuronal function Recent studies suggest that alternative splicing is a regulator of tissue identity and development This is particularly relevant to the brain where developmental regulation and heterogeneous cell population play a crucial role in shaping its function For a long time technological limitations in detecting and measuring alternatively spliced transcripts hindered the progress in understanding the biology of alternative splicing Recent advances in long read and native mRNA sequencing and robust computational tools allow us to capture and quantify in their full length form Public transcriptomics datasets can be utilized for the meta analysis of alternative splicing landscapes of various experimental conditions and disease samples In addition protein isoform detection complements mRNA isoform levels Given its biological significance and recent advances the objective of this Research Topic is to assemble current knowledge views and challenges in the studies of alternative splicing in brain function

**Pathogenic mechanism of porcine viral disease** Mengmeng Zhao,Lingxue Yu ,Weili Kong,Xuelian Zhang,2024-09-30 Swine virus diseases pose a significant threat to the pig industry due to their highly contagious nature and ability to cause immense harm. Once a pig is infected the risk extends to the entire farm or even a larger area. In recent years there has been an emergence and re emergence of disease pathogens that have been able to overcome existing immune defense mechanisms through continuous recombination and evolution. As a result current immune prevention and control measures have become ineffective. Notable examples of these diseases include African swine fever virus ASFV porcine reproductive and respiratory syndrome virus PRRSV porcine epidemic diarrhea virus PEDV and porcine pseudorabies virus PRV. These viruses constantly mutate under various selection pressures including immunity within the host body and vaccine induced immunity. Furthermore with the increase in international trade the spread of these viruses has become more rapid and extensive. Moreover it is worth noting that similar virus strains originating from different regions have the potential to undergo recombination resulting in the emergence of recombinant mutant strains. These mutant strains can pose a challenge to existing immune prevention and control measures thereby adding complexity to the ongoing efforts in disease prevention and control.
