**Morphometrics with R** Julien Claude,2008-12-15 This book aims to explain how to use R to perform morphometrics Morphometric analysis is the study of shape and size variations and covariations and their covariations with other variables Morphometrics is thus deeply rooted within statistical sciences While most applications concern biology morphometrics is becoming common tools used in archeological palaeontological geographical or medicine disciplines Since the recent formalizations of some of the ideas of predecessors such as D'Arcy Thompson and thanks to the development of computer technologies and new ways for appraising shape changes and variation morphometrics have undergone and are still undergoing a revolution Most techniques dealing with statistical shape analysis have been developed in the last three decades and the number of publications using morphometrics is increasing rapidly However the majority of these methods cannot be implemented in available software and therefore prospective students often need to acquire detailed knowledge in informatics and statistics before applying them to their data With acceleration in the accumulation of methods accompanying the emerging science of statistical shape analysis it is becoming important to use tools that allow some autonomy R easily helps fulfill this need R is a language and environment for statistical computing and graphics Although there is an increasing number of computer applications that perform morphometrics using R has several advantages that confer to users considerable power and possible new horizons in a world that requires rapid adaptability

Paulo Gouveia Almeida,Juan Carlos Navarro,2015-07-06 Zoonoses are currently considered as one of the most important threats for public health worldwide Zoonoses can be defined as any disease or infection that is naturally transmissible from vertebrate or invertebrate animals to humans and vice versa Approximately 75% of recently emerging infectious diseases affecting humans are diseases of animal origin approximately 60% of all human pathogens are zoonotic All types of potential pathogenic agents including viruses parasites bacteria and fungi can cause these zoonotic infections From the wide range of potential vectors of zoonoses insects are probably those of major significance due to their abundance high plasticity and adaptability to different kinds of pathogens high degrees of synanthropism in several groups and difficulties to apply effective programs of population control Although ticks flies cockroaches bugs and fleas are excellent insects capable to transmit viruses parasites and bacteria undoubtedly mosquitoes are the most important disease vectors Mosquito borne diseases like malaria dengue equine encephalitis West Nile Mayaro or Chikungunya are zoonoses with increasing incidence in last years in tropical and temperate countries Vertebrates can also transmit serious zoonoses highlighting the role of some carnivorous animals in rabies dissemination or the spread of rodent borne diseases in several rural and urban areas Moreover the significance of other food borne zoonoses such as taeniasis trichinellosis or toxoplasmosis may not been underestimated According to WHO FAO and OIE guidelines an emerging zoonotic disease can be defined as a zoonosis that is newly recognized or newly evolved or that has occurred previously but shows an increase of incidence or expansion in geographical host or vector range There are many factors that can provoke or accelerate the emergence of zoonoses such as environmental changes habitat modifications variations of human and animal demography pathogens and vectors anomalous mobilization related with human practices and globalization deterioration of the strategies of vector control or changes in pathogen genetics To reduce public health risks from zoonoses is absolutely necessary to acquire an integrative perspective that includes the study of the complexity of interactions among humans animals and environment in order to be able to fight against these issues of primary interest for human health In any case although zoonoses represent significant public health threats many of them still remain as neglected diseases and consequently are not prioritized by some health international organizations **AMSTAT News** American Statistical Association,2008 **Multivariate Morphometrics** R.
