Current Progress and Challenges in the Development of a Hepatitis C Virus Vaccine Steven K.H. Foung, Thomas F. Baumert, 2019-01-22 More than 70 million people worldwide are infected with hepatitis C virus a major cause of liver cirrhosis liver failure and hepatocellular carcinoma world wide In the last decade this cancer has emerged as the second leading cause of cancer death and the global burden is increasing by two million new infections per year mainly due to injection drug use An effective vaccine will be the most effective means to contain the spread of this virus worldwide The articles in this Research Topic describe the progress that has been made towards a preventive vaccine and the challenges that still need to be overcome to ultimately achieve this goal The Hepatitis C Viruses C.H. Hagedorn, C.M.

Rice, 2012-12-06 Chronic hepatitis C is a major worldwide health problem affecting more than 170 million people Chronic infections lead to cirrhosis and liver failure or hepatocellular cancer in many instances This volume includes comprehensive reviews that cover much of the vast literature that has appeared since the identification of the hepatitis C virus RNA genome It will be an invaluable collection for anyone wanting an up to date picture of HCV transmission molecular virology immune response cellular molecular pathogenesis and possible avenues for developing effective new therapeutics and vaccines

Plant Molecular Farming for the Production of Next-Generation Vaccines and Biologics - Prospects and Challenges, 2024-03-11 Infectious diseases are still a major threat to public health The vaccine remains the most important and safer way of combating infectious diseases Therefore there is an urgent need to look for new ways of vaccine generation that can cut down production costs and processing time The development of rDNA technology allows the expression and purification of proteins in unlimited quantity thus opening an avenue for the development of protein based vaccines as a prophylactic measure against infectious diseases Recombinant therapeutic proteins derived from biological sources including mammalian cells microorganisms suspension cultures or genetically modified organisms by employing biotechnological processes are widely used in clinical applications especially for the treatment and prevention of human or veterinary infections Since the development of human insulin by utilizing recombinant DNA technology in E coli in the 1980s the recombinant therapeutic protein production field has significantly grown and gained major attention Plant molecular farming the production of biologics in plant cells or transgenic plants could offer a cost effective adaptable strategy to produce biologics particularly in low resource settings Molecular farming based strategies could provide an alternative strategy to traditional biologics or vaccine production enabling rapid development effective deployment and safe administration of vaccines The concept of PMF was initially documented three decades back when recombinant growth hormone was produced in tobacco and sunflower plants Even with such a long history of significant advantages and several proof of concept studies very few plant derived therapeutic products have been clinically translated However the recent progress around the approval of the plant based biopharmaceutical ZMapp by the FDA Medicago's COVID 19 vaccine by Health Canada and the safety of a few plant derived

vaccines in clinical trials have displayed the potential of a plant platform for biopharmaceutical production Furthermore constant efforts are being made with respect to the optimization of expression techniques downstream processing and defining standard guidelines for plant products to make an impact of plant derived products on an array of applications

**Topics in Vaccine Adjuvant Research** Dale R. Spriggs, Wayne C. Koff, 1990-12-19 *Topics in Vaccine Adjuvant Research* provides a concise focused review of the immunological basis of adjuvant activity. The first section of the book contains several chapters that discuss key issues in cellular immunology such as antigen processing and presentation, cytokine regulation of immune responses and mucosal immunology. The second section consists of brief chapters on the mechanism of action of several adjuvants including IL 2, nonionic block polymers and cholera toxin. The major goals of this book are to define what is known about the mechanisms of adjuvant activity, show how research in cellular immunology can be used to help understand adjuvant action and define possible areas where adjuvants might be useful probes for dissecting basic immunological processes. Immunologists, microbiologists and infectious disease researchers will find this book an invaluable addition to their reference library.

*Why Vaccines to HIV, HCV and Malaria Have So Far Failed - Challenges to Developing Vaccines against Immunoregulating Pathogens* Shuo Li, Magdalena Plebanski, Peter Smooker, Eric J. Gowans, 2016-09-14

Despite continuous progress in the development of anti viral and anti bacterial parasite drugs the high cost of medicines and the potential for re infection especially in high risk groups suggest that protective vaccines to some of the most dangerous persistent infections are still highly desirable. There are no vaccines available for HIV, HCV and Malaria and all attempts to make a broadly effective vaccine have failed so far. In this Research Topic we look into why vaccines have failed over the years and what we have learned from these attempts. Rather than only showing positive results this issue aims to reflect on failed efforts in vaccine development. Coming to understand our limitations will have theoretical and practical implications for the future development of vaccines to these major global disease burdens.
