*Neurophysiological Measures* Felix Putze, Christian Mühl, Fabien Lotte, Stephen Fairclough, Christian Herff, 2019-02-05

Executive cognitive functions like working memory determine the success or failure of a wide variety of different cognitive tasks such as problem solving navigation or planning Estimation of constructs like working memory load or memory capacity from neurophysiological or psychophysiological signals would enable adaptive systems to respond to cognitive states experienced by an operator and trigger responses designed to support task performance e.g. by simplifying the exercises of a tutor system when the subject is overloaded or by shutting down distractions from the mobile phone The determination of cognitive states like working memory load is also useful for automated testing assessment or for usability evaluation While there exists a large body of research work on neural and physiological correlates of cognitive functions like working memory activity fewer publications deal with the application of this research with respect to single trial detection and real time estimation of cognitive functions in complex realistic scenarios Single trial classifiers based on brain activity measurements such as electroencephalography functional near infrared spectroscopy physiological signals or eye tracking have the potential to classify affective or cognitive states based upon short segments of data For this purpose signal processing and machine learning techniques need to be developed and transferred to real world user interfaces The goal of this Frontiers Research Topic was to advance the State of the Art in signal based modeling of cognitive processes We were especially interested in research towards more complex and realistic study designs for example collecting data in the wild or investigating the interaction between different cognitive processes or signal modalities Bringing together many contributions in one format allowed us to look at the state of convergence or diversity regarding concepts methods and paradigms

**What makes written words so special to the brain?** Gui Xue, Urs Maurer, Mohamed L Seghier, 2015-01-22 Reading is an integral part of life in today's information driven societies Since the pioneering work of Dejerine on word blindness in brain lesioned patients the literature has increased exponentially from neuropsychological case reports to mechanistic accounts of word processing at the behavioural neurofunctional and computational levels tapping into diverse aspects of visual word processing These studies have revealed some exciting findings about visual word processing including how the brain learns to read how changes in literacy impact upon word processing strategies and whether word processing mechanisms vary across different alphabetic logographic or artificial writing systems Other studies have attempted to characterise typical and atypical word processes in special populations in order to explain why dyslexic brains struggle with words how multilingualism changes the way our brains see words and what the exact developmental signatures are that would shape the acquisition of reading skills Exciting new insights have also emerged from recent studies that have investigated word stimuli at the system network level by looking for instance at how the reading system interacts with other cognitive systems in a context dependent fashion how visual language stimuli are integrated into the speech processing streams how both left and right hemispheres cooperate and interact during word processing and what the exact

contributions of subcortical and cerebellar regions to reading are The contributions to this Research Topic highlight the latest findings regarding the different issues mentioned above particularly how these findings can explain or model the different processes mechanisms pathways or cognitive strategies by which the human brain sees words The introductory editorial summarising the contributions included here highlights how varieties of behavioural tests and neuroimaging techniques can be used to investigate word processing mechanisms across different alphabetic and logographic writing systems

**How and Why Does Spatial-Hearing Ability Differ among Listeners? What Is the Role of Learning and Multisensory Interactions?** Guillaume Andéol,Brian D. Simpson,Ewan A. Macpherson,2016-08-29 Spatial hearing ability has been found to vary widely across listeners A survey of the existing auditory space perception literature suggests that three main types of factors may account for this variability physical factors e g acoustical characteristics related to sound localization cues perceptual factors e g sensory cognitive processing perceptual learning multisensory interactions and methodological factors e g differences in stimulus presentation methods across studies However the extent to which these and perhaps other still unidentified factors actually contribute to the observed variability in spatial hearing across individuals with normal hearing or within special populations e g hearing impaired listeners remains largely unknown Likewise the role of perceptual learning and multisensory interactions in the emergence of a multimodal but unified representation of auditory space is still an active topic of research A better characterization and understanding of the determinants of inter individual variability in spatial hearing and of its relationship with perceptual learning and multisensory interactions would have numerous benefits In particular it would enhance the design of rehabilitative devices and of human machine interfaces involving auditory or multimodal space perception such as virtual auditory multimodal displays in aeronautics or navigational aids for the visually impaired For this Research Topic we have considered manuscripts that present new methods or review existing methods for the study of inter individual differences present new data or review existing data concerning acoustical features relevant for explaining inter individual differences in sound localization performance present new or review existing psychophysical or neurophysiological findings concerning spatial hearing and or auditory perceptual learning and or multisensory interactions in humans normal or impaired young or older listeners or other species discuss the influence of inter individual differences on the design and use of assistive listening devices rehabilitation or human machine interfaces involving spatial hearing or multimodal perception of space ergonomics
