

**ACLS Test Prep (PALS, BLS, ACLS) | American Heart Association | Comprehensive Study and Practice Guide**

A 50-year-old man who has been eating steak in a restaurant abruptly stands up and grabs his neck. The rescuer determines that the victim is choking. The best response is to:  Use abdominal thrusts

**"Rationale:"** Abdominal thrusts, also known as the Heimlich maneuver, are the preferred way to dislodge a foreign object from an adult's airway.

An infant who had been choking becomes unresponsive. The rescuer should:  Begin CPR

**"Rationale:"** Back blows, chest thrusts, or abdominal thrusts are not to be used if the choking victim becomes unconscious. Instead, CPR should begin immediately.

Efforts to relieve choking should be stopped when:

- A) The obstruction is removed
- B) The victim becomes unresponsive
- C) The victim begins breathing normally
- D) Any of the above occurs  Any of the above occurs

**"Rationale:"** There is no need to continue choking interventions if the object is dislodged and the patient can breathe once again. If a victim becomes unresponsive/unconscious, treat the situation as cardiopulmonary arrest and start CPR. Efforts to relieve choking should be abandoned.

Chest compressions for an adult are performed:  At a rate between 100 and 120 compressions per minute.
