

1. LED & LASER CHARACTERISTICS

AIM:

Study the V-I characteristics of the given LED.

Apparatus:

LED, resistors, connecting wires and voltmeter and milli ammeter, variable battery.

Principle:

A light-emitting diode (LED) is a two-lead semiconductor light source. It is a basic p-n junction diode, which emits light when connected in forward biased. When a proper voltage is applied to the leads, electrons are able to recombine with holes within the depletion region, releasing energy in the form of photons.

Theory:

The LED is a type of diode converting electrical energy into light. LED (light emitting diode) is a p-n diode but the main difference is that diode is made of Indirect Semiconductor (Si, Ge) material and LED is made of direct semiconductor material (GaAs). GaAs devices generate less noise than most other types of semiconductor components. This is important in weak-signal amplification. Gallium arsenide is used in the manufacture of light-emitting diodes (LEDs), which are found in optical communications and control systems.

Light emitting diodes are made from a very thin layer of fairly heavily doped semiconductor material and depending on the semiconductor material used and the amount of doping, when forward biased an LED will emit a colored light at a particular spectral wavelength. When it is forward biased the holes move from p to n and electrons flow from n to p. This current flow will cause electrons and holes to move in a manner that an electron will move to fill a hole. When this happens, the electron will fall to a lower energy level and this will release an amount of energy in the form of photons. In a larger scale, these photons will produce light. Thus LED emits light under forward biased condition. Under reverse biased condition, there is no recombination due to majority carriers, so there is no emission of light. Different LED compounds emit light in specific regions of the visible light spectrum and therefore produce different intensity levels. The exact choice of the semiconductor material used will determine the overall wavelength of the photon light emissions and therefore the resulting color of the light emitted.

The general notation of LED along with its terminals when it is in forward biased is shown in the
