Optimization Algorithms And Consistent Approximations Applied Mathematical Sciences:

Optimization Elijah Polak, 2012-12-21 This book deals with optimality conditions algorithms and discretization techniques for nonlinear programming semi infinite optimization and optimal control problems The unifying thread in the presentation consists of an abstract theory within which optimality conditions are expressed in the form of zeros of optimality functions algorithms are characterized by point to set iteration maps and all the numerical approximations required in the solution of semi infinite optimization and optimal control problems are treated within the context of consistent approximations and algorithm implementation techniques Traditionally necessary optimality conditions for optimization problems are presented in Lagrange F John or Karush Kuhn Tucker multiplier forms with gradients used for smooth problems and subgradients for nonsmooth problems We present these classical optimality conditions and show that they are satisfied at a point if and only if this point is a zero of an upper semicontinuous optimality junction The use of optimality functions has several advantages First optimality functions can be used in an abstract study of optimization algorithms Second many optimization algorithms can be shown to use search directions that are obtained in evaluating optimality functions thus establishing a clear relationship between optimality conditions and algorithms Third establishing optimality conditions for highly complex problems such as optimal control problems with control and trajectory constraints is much easier in terms of optimality functions than in the classical manner In addition the relationship between optimality conditions for finite dimensional problems and semi infinite optimization and optimal control problems becomes transparent

Topics in Industrial Mathematics H Neunzert, Abul Hasan Siddiqi, 2013-06-29 Industrial Mathematics is a relatively recent discipline It is concerned primarily with transforming technical organizational and economic problems posed by industry into mathematical problems solving these problems by approximative methods of analytical and or numerical nature and finally reinterpreting the results in terms of the original problems In short industrial mathematics is modelling and scientific computing of industrial problems Industrial mathematicians are bridge builders they build bridges from the field of mathematics to the practical world to do that they need to know about both sides the problems from the companies and ideas and methods from mathematics As mathematicians they have to be generalists If you enter the world of industry you never know which kind of problems you will encounter and which kind of mathematical concepts and methods you will need to solve them Hence to be a good industrial mathematician you need to know a good deal of mathematics as well as ideas already common in engineering and modern mathematics with tremendous potential for application Mathematical concepts like wavelets pseudorandom numbers inverse problems multigrid etc introduced during the last 20 years have recently started entering the world of real applications Industrial mathematics consists of modelling discretization analysis and visualization To make a good model to transform the industrial problem into a mathematical one such that you can trust the prediction of the model is no easy task
