Natural Resistance to and Host-Directed Prevention of Tuberculosis Robert Wilkinson, Anna Kathleen

Coussens, Thomas Richard Hawn, 2020-06-16 Tuberculosis remains an important bacterial disease responsible for more than one million deaths per year. The risk of overt disease is highest in the first year post infection nevertheless asymptomatic chronic infection referred to as Latent Tuberculosis Infection (LTBI) may also be established. LTBI cannot be ascertained directly; it can only be inferred from a skin or blood test of immune sensitization. Nevertheless, it is often stated that one third of the world's population has LTBI. The central tenet of Tuberculosis control has therefore been antibiotic treatment of overt disease and the selective less intensive antibiotic treatment of patients considered at risk of progression of LTBI. Much Tuberculosis research has been directed towards elucidation of the mechanisms of host susceptibility to disease. The best characterized immune risk factor for Tuberculosis is HIV-1 co-infection. Others include anti-TNF therapies, Diabetes Mellitus, other forms of immunosuppression and cigarette smoking. However, in most clinical cases of Tuberculosis, no underlying immunological defect can be identified. Since the general assumption is that most people infected with *Mycobacterium tuberculosis* never develop disease, this suggests that most people who are exposed and infected with *Mycobacterium tuberculosis* harbor immunity to Tuberculosis. This encourages the hypothesis that vaccination should be possible and indeed Bacille Calmette Guérin (BCG) vaccination confers protection against disseminated disease in children. However, BCG vaccination is not associated with reduced pulmonary disease in adults, which is a significant limitation. Furthermore, it has been recognized that increased resistance to Tuberculosis occurs in specific populations. These include: i) heavily exposed persons in whom tests of immune sensitization nevertheless remain persistently negative; ii) children aged between 5 years and puberty; and iii) persons with documented persistent positive tests of sensitization who nevertheless never manifest disease. As progress towards the elimination of Tuberculosis is insufficient under current antibiotic-based strategies, the idea to enhance immune resistance either via improved vaccination or enhanced natural immunity is important. Recent research interest has therefore increased attention on the analysis of resistance in humans. The current BCG vaccine is conventionally thought to prevent progression of established infection. However, vaccination strategies now also envisage the prevention of infection and relapse. There has been a rapid growth of interest in adjunctive host-directed immune interventions which aim to either enhance protective immunity or to regulate pathological tissue-damaging immunity. However, the idea of host-directed prevention is less widely discussed.

Tuberculosis and the Tubercle Bacillus William R. Jacobs, Jr., Helen McShane, Valerie Mizrahi, Ian M. Orme, 2020-07-15 Can today's innovative practices and molecular tools tame this ancient disease? One third of the world's population is infected with tuberculosis (TB) with about 10 million new cases annually. To combat TB and its agent *Mycobacterium tuberculosis*, the World Health Organization launched The End TB Strategy which aims to slash the suffering and cost of TB by 2035. This makes the second edition of *Tuberculosis and the Tubercle Bacillus* edited by Jacobs, McShane, Mizrahi, and Orme an extremely valuable resource for scientists and clinicians. The editors have gathered their colleagues from around the world to present the latest on the molecular biology of *M. tuberculosis* and related species, the host pathogen

interactions that enable invasion and the host's immune response to M tuberculosis infection The basic clinical and translational research presented in this book supports the goals of WHO's End TB Strategy by driving toward the development of effective vaccines rapid molecular diagnostics and anti TB drugs Creating an effective tuberculosis vaccine Understand the innate and adaptive immune response to M tuberculosis infection its study in established animal models and how this information is being used to develop new vaccines against TB Formulating new antituberculosis drugs Learn the challenges and methods for evaluating new drugs in preclinical trials with a focus on drugs that work against persisters and those that act on the electron transport complex and ATP synthase of M tuberculosis Overcoming the challenges of diagnosing tuberculosis Review new diagnostic tools that are simple rapid affordable specific sensitive and safe including molecular based diagnostic methods such as GeneXpert MTB RIF Using molecular genomic and bioinformatics tools to understand the biology and evolution of Mycobacterium Explore current research on the molecular mechanisms that M tuberculosis uses to evade the immune system enter a state of nonreplicating persistence and become reactivated The second edition of Tuberculosis and the Tubercle Bacillus presents the latest research on a microorganism that is exquisitely well adapted to its human host This pathogen continues to confound scientists clinicians and public health specialists who will all find much valuable information in this comprehensive set of reviews **The Journal of Immunology** ,2007
