Pattern Recognition Methods And Applications:

Pattern Recognition J.P. Marques de Sá, 2012-12-06 Pattern recognition currently comprises a vast body of methods supporting the development of numerous applications in many different areas of activity. The generally recognized relevance of pattern recognition methods and techniques lies for the most part in the general trend of intelligent task emulation which has definitely pervaded our daily life. Robot assisted manufacture, medical diagnostic systems, forecast of economic variables, exploration of Earth's resources and analysis of satellite data are just a few examples of activity fields where this trend applies. The pervasiveness of pattern recognition has boosted the number of task specific methodologies and enriched the number of links with other disciplines. As counterbalance to this dispersive tendency there have been more recently new theoretical developments that are bridging together many of the classical pattern recognition methods and presenting a new perspective of their links and inner workings. This book has its origin in an introductory course on pattern recognition taught at the Electrical and Computer Engineering Department, Oporto University. From the initial core of this course the book grew with the intent of presenting a comprehensive and articulated view of pattern recognition methods combined with the intent of clarifying practical issues with the aid of examples and applications to real life data. The book is primarily addressed to undergraduate and graduate students attending pattern recognition courses of engineering and computer science curricula.

Pattern Recognition - Selected Methods and Applications Andrzej Zak, 2019 Pattern recognition despite its relatively short history has already found practical application in many areas of human activity. Systems of pattern recognition usually support people in performing tasks related to ensuring security including access to premises and devices, detection of unusual changes e.g. in medicine, cartography, geology, diagnosing technical conditions of devices and many others. Nevertheless, pattern recognition is probably the most developing area because of the great demand for such solutions in the different areas of our lives. In this book we have collected the experience of scientists from different parts of the world who have researched diverse areas connected directly or indirectly with pattern recognition. We hope that this book will be a treasure trove of knowledge and inspiration for further research in the field of pattern recognition.

Pattern Recognition Khalid Hosny, Jorge De La Calleja, 2013-08-23 Pattern recognition Methods and Applications includes contributions from university educators and active research experts This book is intended to serve as a basic reference on pattern recognition especially on the topics related to image and graphics processing shape analysis text processing and bioinformatics analysis Chapter 1 proposes a review of traditional outlier detection methods and their recent enhancements Some particular data representations are presented A case study based on a synthetic data is proposed in order to demonstrate the potential of a fuzzy logic approach which combines several techniques Chapter 2 studies the conditions for which the solution given by the Maximum Entropy Principle is equivalent to that given by Support Vector Machines It describes a unifying framework that computes the probability density function and the optimal separating surface from examples Chapter 3 presents techniques for building multi sensor fusion classifiers A pairwise diversity based ranking strategy is introduced to select a subset of ensemble components which when combined will be more diverse than any other component subset of the same size Chapter 4 proposes a neural network based differential evolution approach for face recognition FR The approach combines neural network classifiers and differential evolution updates applies both 2D texture and 3D surface feature vectors and effectively enhance the FR performance Chapter 5 proposes an efficient margin based linear embedding method that exploits the nearest hit and the nearest miss samples only Chapter 6 proposes an efficient algorithm to construct the skeleton of a binary image as a geometric graph whose edges are Bezier curves 1 and 2 degrees Chapter 7 presents a novel structured light means with no coding procedure involved By projecting a binary rhombic pattern and computing the 3D surface normal at grid points the 3D reconstruction procedure can be realized via the proposed surface integration methods Chapter 8 focuses on exploring the potential of virtual worlds in order to train appearance based models for pedestrian detections in ADAS A de facto pedestrian detector is used for this task a linear SVM with HOG features Chapter 9 proposes a technique for partially automating the creation of a large scale dictionary or corpus More specifically this involves adding unknown words to an existing language resource in this case a thesaurus Chapter 10 proposes a probabilistic model that explicitly considers the document relations represented by links A given document is modeled as a mixture of a set of topic distributions each of which is borrowed cited from a document that is related to the given document Chapter 11 proposes a improve of the segmentation method by topic ClustSeg The proposed improvement is a strategy to automatically calculate the threshold for deciding the cohesiveness between textual units This proposal can be used by other methods of text segmentation by topic Chapter 12 proposes a comparative analysis of Wavelets used as input attributes of support vector machines which will be responsible for classification of pathological voices Chapter 13 introduces a complete methodology for automatic human chromosome classification The methodology isolates the chromosomes from microscopic images extracts their characteristic band profiles and then classifies them Chapter 14 presents a compositional spectra approach for classifying bacterial genomes The problem of bacteria classification arose long before the start of the Genomic

Era Chapter 15 describes how spectroscopic and chromatographic methods coupled to pattern recognition multivariate algorithms can be an excellent tool for the determination of fuel compliance to technical specifications and origin determination purposes
