Lozier, M. Kitis, C. Colvin, J. Kim, B. Mi, B. Marinas, 2004-01-01 High pressure HP membranes reverse osmosis and nanofiltration are used increasingly to treat brackish and organic laden surface waters as water purveyors are forced to utilize lower quality source waters to meet potable water demands In addition reverse osmosis has become an integral part of the advanced reclamation process for the

indirect potable reuse of domestic wastewaters. In these applications HP membranes are expected to serve as a positive barrier to pathogens. To date integrity methods for full scale HP membrane systems have been limited to conductivity and total organic carbon monitoring approaches that can only assess pathogen removals to two logs (99%). The first objective of this research was to determine the integrity of RO and NF membrane systems with respect to viral passage using both particulate MS2 viruses and fluorescent microspheres and soluble Rhodamine WT surrogates. The second objective was to compare the capability of these surrogates for use in assessing integrity of intact and compromised RO and NF membranes when evaluated in a number of configurations.
