Science of Fasting for Healthy Body and Mind Ram Babu Sao,2025-05-31 Fasting has been used for the body to get rid of waste buildup and also for religious and spiritual purification for centuries This book Science of Fasting for Healthy Body and Mind is very fascinating and an exasperating with its simplicity and its vastness Nearly every religious text from the Old and New Testaments of the Upanishads as well as Bible to the Quran calls upon followers to fast periodically as a rite of spiritual purification penitence or preparation for union with God Fasting advocates and claims that the practice can effectively treat serious health conditions like diabetes constipation arthritis and colitis to heart disease and depression In his practice he has seen fasting combined with improving the diet before and afterwards which eliminates lupus arthritis and chronic skin conditions like psoriasis and eczema He says he has also seen fasting heal the digestive tracts of those with ulcerative colitis and Crohn's disease and lower blood pressure Fasting followed by a vegetarian diet interferes with the immune system's activities especially if the immune system is overreacting as it does with and other auto immune diseases He cites half a dozen studies published in medical journals ranging from the American Journal of Physiology Endocrinology and Metabolism to the Scandinavian Journal of Rheumatology Studies published in The Proceedings of the National Academy of Sciences and The Journal of Nutrition in 2003 showed that human beings forced to fast every other day while eating twice the normal amount of food on non fasting days had better insulin control neuronal resistance to injury and other health indicators than people fed calorie restricted diets Fasting may yield psychological benefits as well

Intermittent fasting in chickens Caroline Lindholm,2019-10-16 Broiler breeder chickens are the parent stock used to produce broiler chickens raised for human consumption and have long been caught in a welfare dilemma The immensely successful selection of fast growing meat type chickens over the last 80 years has created a remarkably efficient meat producer and given us access to cheap chicken meat but has also created health problems for the animals These problems especially affect the breeder generation which must be raised with strict feed restriction to limit weight gain and thus maintain physical health and normal fertility At the same time however feed restriction causes chronic hunger and feeding frustration with reduced animal welfare as a result In the EU alone 60 million breeders are affected annually and although the problem is well known within the industry there is financial incentive to keep selecting for even higher growth potential in broilers further increasing the problems for broiler breeders Many strategies for reducing the impact of growth restriction on breeder welfare have been suggested and are usually aimed at somehow increasing the amount of feed given at feeding times This can be done either through adding bulky fibers to the diet or by reducing feeding frequency In this thesis focus is on the latter as we explore the effects of intermittent fasting IF on the welfare of young broiler breeders as well as wild type Red Junglefowl Intermittent fasting or skip a day feeding is supposedly the most common feeding strategy for broiler breeders worldwide but is perceived as welfare reducing and thus illegal in Sweden and several other European countries In spite of this the scientific knowledge of

how this type of feeding affects chicken welfare is scarce Assessing the overall effect of IF on breeder welfare is complicated by large variations in both physiological and behavioral parameters between feeding and fasting days but it does appear that chicken welfare is improved at least on the feeding days of IF regimens It also seems that some of the health benefits reported from mammalian studies of IF may apply to chickens as well although behavioral indicators still point to welfare issues unless the level of feed restriction can be relaxed In comparison with daily feed restriction IF appears to increase the motivation for feed consumption but to reduce the motivation for appetitive behaviors such as foraging which may explain why birds fed on this type of schedule are often reported as calmer
