Neuromathematics Of Vision Lecture Notes In Morphogenesis:

Neuromathematics of Vision Giovanna Citti, Alessandro Sarti, 2014-02-08 This book is devoted to the study of the functional architecture of the visual cortex. Its geometrical structure is the differential geometry of the connectivity between neural cells. This connectivity is building and shaping the hidden brain structures underlying visual perception. The story of the problem runs over the last 30 years since the discovery of Hubel and Wiesel of the modular structure of the primary visual cortex and slowly comes towards a theoretical understanding of the experimental data on what we now know as functional architecture of the primary visual cortex. Experimental data comes from several domains: neurophysiology, phenomenology of perception and neurocognitive imaging. Imaging techniques like functional MRI and diffusion tensor MRI allow to deepen the study of cortical structures. Due to this variety of experimental data, neuromathematics deals with modelling both cortical structures and perceptual spaces. From the mathematical point of view, neuromathematical call for new instruments of pure mathematics: sub-Riemannian geometry models horizontal connectivity; harmonic analysis in non-commutative groups allows to understand pinwheels structure as well as non-linear dimensionality reduction; is at the base of many neural morphologies and possibly of the emergence of perceptual units. But at the center of the neurogeometry is the problem of harmonizing contemporary mathematical instruments with neurophysiological findings and phenomenological experiments in an unitary science of vision. The contributions to this book come from the very founders of the discipline.

Morphogenesis of Symbolic Forms: Meaning in Music, Art, Religion, and Language Wolfgang Wildgen, 2023-03-01 In the present book, the starting line is defined by a morphogenetic perspective on human communication and culture. The focus is on visual communication, music, religion, myth, and language, i.e., on the symbolic forms at the heart of human cultures. Ernst Cassirer. The term morphogenesis has more precisely the meaning given by Ren Thom (1923-2002) in his book *Morphogenesis and Structural Stability* (1972) and the notions of self-organization and cooperation of subsystems in the *Synergetics* of Hermann Haken (1927). The naturalization of communication and cultural phenomena is the favored strategy but the major results of the involved disciplines (art history, music theory, religious science, and linguistics) are respected. Visual art from the Paleolithic to modernity stands for visual communication. The present book focuses on studies of classical painting and sculpture (e.g., Leonardo da Vinci, William Turner, and Henry Moore) and modern art (e.g., Jackson Pollock and Joseph Beuys). Musical morphogenesis embraces classical music from J.S. Bach to Arnold Schönberg and political songwriting (Bob Dylan, Leonard Cohen). The myths of pre-literary societies show the effects of self-organization in the re-assembly bricolage of traditions. Classical polytheistic and monotheistic religions demonstrate the unfolding of basic germs, religious attractors, and their reduction in periods of crisis. The self-organization of complex religious networks and rationalized macro-structures in theologies. Significant tendencies are analyzed in the case of Buddhism and Christianity. Eventually, a holistic view of symbolic communication and human culture emerges based on state-of-the-art in evolutionary

Alessandro Sarti,2024-06-03 Jean Petitot is a polyhedral thinker whose contributions has been fundamental in a number of disciplines such as epistemology morphodynamics differential geometry structural semiotics neurogeometry phenomenology linguistics cognitive grammars the theory of catastrophes social sciences literary studies and aesthetics This book is a homage to his huge contribution about the main concepts of morphogenesis and meaning that constitute the center of gravity around which Petitotian reflection revolves and returns The scientific path of Jean Petitot develops between these two poles topology and meaning At stake it was to challenge the hiatus separating the exact sciences from the humanities that was the main point of the Petitot seminar of EHESS Epistemology of Models By designing the appropriate qualitative dynamics between the two poles form and meaning it is possible to understand the Saussurian sign in structural semiotics or the Greimasian semiotic square for deep narrative structures or even the canonical formula of the myth of L vi Strauss in structural anthropology These are just few results in applying the theory of catastrophes to the emergence of meaning The book is a collection of testimonies by distinguished authors who worked extensively with Jean Petitot in the different fields of Mathematics Neurogeometry Semiotics Aesthetics and Epistemology An extensive bibliography of Petitot s work is also presented [Mathematical Tools for Neuroscience](#) Richard A. Clement,2022-04-21 This book provides a brief but accessible introduction to a set of related mathematical ideas that have proved useful in understanding the brain and behaviour If you record the eye movements of a group of people watching a riverside scene then some will look at the river some will look at the barge by the side of the river some will look at the people on the bridge and so on but if a duck takes off then everybody will look at it How come the brain is so adept at processing such biological objects In this book it is shown that brains are especially suited to exploiting the geometric properties of such objects Central to the geometric approach is the concept of a manifold which extends the idea of a surface to many dimensions The manifold can be specified by collections of n dimensional data points or by the paths of a system through state space Just as tangent planes can be used to analyse the local linear behaviour of points on a surface so the extension to tangent spaces can be used to investigate the local linear behaviour of manifolds The majority of the geometric techniques introduced are all about how to do things with tangent spaces Examples of the geometric approach to neuroscience include the analysis of colour and spatial vision measurements and the control of eye and arm movements Additional examples are used to extend the applications of the approach and to show that it leads to new techniques for investigating neural systems An advantage of following a geometric approach is that it is often possible to illustrate the concepts visually and all the descriptions of the examples are complemented by comprehensively captioned diagrams The book is intended for a reader with an interest in neuroscience who may have been introduced to calculus in the past but is not aware of the many insights obtained by a geometric approach to the brain Appendices contain brief reviews of the required background knowledge in neuroscience and calculus [Diagrams and](#)

Semiotic Perception and Dynamic Forms of Meaning Antonino

Bondi, David Piotrowski, Yves-Marie Visetti, 2023-09-23 What do we mean by semiotic perception Why should the concepts of perception and expressivity be reinterpreted within the encompassing framework of a dynamic theory of semiotic fields and forms Can we redeploy the concept of form in such a way as to make explicit such a native solidarity chiasmatic would have said Merleau Ponty between perception praxis and expression and first and foremost in the activity of language right to the heart of the life of the social and speaking animal that we are What then would be the epistemological and ontological consequences and how might this affect the way we describe semiolinguistic forms This book aims to provide answers to these questions by opening up avenues of research on how to understand the linguistic and semiotic dimensions at work in the constitution of experience both individual and collective

Differential Heterogenesis Alessandro Sarti, Giovanna

Citti, David Piotrowski, 2022-07-15 This book describes about unlike usual differential dynamics common in mathematical physics heterogenesis is based on the assemblage of differential constraints that are different from point to point The construction of differential assemblages will be introduced in the present study from the mathematical point of view outlining the heterogeneity of the differential constraints and of the associated phase spaces that are continuously changing in space and time If homogeneous constraints well describe a form of swarm intelligence or crowd behaviour it reduces dynamics to automatisms by excluding any form of imaginative and creative aspect With this study we aim to problematize the procedure of homogenization that is dominant in life and social science and to outline the dynamical heterogeneity of life and its affective semiotic social historical aspects Particularly the use of sub Riemannian geometry instead of Riemannian one allows to introduce disjointed and autonomous areas in the virtual plane Our purpose is to free up the dynamic becoming from any form of unitary and totalizing symmetry and to develop forms action thought by means of proliferation juxtaposition and disjunction devices After stating the concept of differential heterogenesis with the language of contemporary mathematics we will face the problem of the emergence of the semiotic function recalling the limitation of classical approaches Hjelmslev

Saussure Husserl and proposing a possible genesis of it from the heterogenetic flow previously defined We consider the conditions under which this process can be polarized to constitute different planes of Content C and Expression E each one equipped with its own formed substances A possible but not unique process of polarization is constructed by means of spectral analysis that is introduced to individuate E C planes and their evolution The heterogenetic flow solution of differential assemblages gives rise to forms that are projected onto the planes offering a first referring system for the flow that constitutes a first degree of semiosis

Glossary of Morphology Federico Vercellone, Salvatore Tedesco, 2020-12-01

This book is a significant novelty in the scientific and editorial landscape Morphology is both an ancient and a new discipline that rests on Goethe's heritage and re-forms it in the present through the concepts of form and image The latter are to be understood as structural elements of a new cultural grammar able to make the late modern world intelligible In particular compared to the original Goethean project but also to C P Snow's idea of unifying the two cultures the fields of morphological culture that are the object of this glossary have profoundly changed The ever increasing importance of the image as a polysemic form has made the two concepts absolutely transitive so to speak This is concomitant with the emergence of a culture that revolves around the image attracting the verbal logos into its orbit Incidentally even the hermeneutic relationship between past and present relies more and more on the image causing deep changes in cultural environments Form and image are not just bridging concepts as in the field of ancient morphology but real transitive concepts that define the state of a culture From the Internet to smartphones television advertising etc we are witnessing as Horst Bredekamp observes an immense mass of images that fill our time and affect the most diverse areas of our culture The ancient connection between science and art recalled by Goethe emerges with unusual evidence thanks to intersecting patterns and expressive forms that are sometimes shared by different forms of knowledge Creating a glossary and a culture of these intersections is the task of morphology which thus enters into the boundaries between aesthetics art design advertising and sciences from mathematics to computer science to physics and to biology in order to provide the founding elements of a grammar and a syntax of the image The latter in its formal quality both expressive and symbolic is a fundamental element in the unification of the various kinds of knowledge which in turn come to be configured in this regard also as styles of vision The glossary is subdivided into contiguous sections within a complex framework of cross references In addition to the two curators the book features the collaboration of a team of scholars from the individual disciplines appearing in the glossary

Plasticity and Discontinuity Silvia Vizzardelli, Riccardo Panattoni, 2026-01-01 This book analyses the concept of creation from the perspective of philosophy psychoanalysis and Life sciences What does it mean to think life beyond form The essays gathered in this book enact a shared gesture to interrogate the living the subject the body and knowledge not from the standpoint of what is given but from that which erupts from that which emerges without guarantee from that which occurs without having been foreseen Situated at the intersections of ethics and science biology and psychoanalysis ontology and

aesthetics these texts compose a theoretical cartography of discontinuity. They traverse conceptual figures such as fulguration, the ontological leap, generative regression, the infans, the infinitesimal intensity, and modulation, not fixed categories but vital tensions capable of opening the real to non deductive, non identitarian, non evolutionary modes of thought. At the core of this inquiry the germ cell emerges as a theoretical figure not as a biological foundation but as a symbolic locus of openness, a crossing point between writing and generation where the living exposes itself to its own originary discontinuity. Here the living is no longer the object of science but a field of inscription, a surface traversed by forces, modulations and drifts; every subject is an unstable trace, every beginning a rupture. Knowledge in this perspective does not describe the world, it accompanies its becoming, attending to the unforeseen of its emergence. *Theories and Models of Urbanization* Denise Pumain, 2020-01-02. This book provides a thorough discussion about fundamental questions regarding urban theories and modeling. It is a curated collection of contributions to a workshop held in Paris on October 12th and 13th 2017 at the Institute of Complex Systems by the team of ERC GeoDiverCity. There are several chapters conveying the answers given by single authors to problems of conceptualization and modeling, and others in which scholars reply to their conception and question them. Even the chapters transcribing keynote presentations were rewritten according to contributions from the respective discussions. The result is a complete state of the art of what is our knowledge about urban processes and their possible formalization.
