Maul,1989 *A Disaggregate Negative Binomial Regression Procedure for Count Data Analysis* Venkatram Ramaswamy,Eugene Anderson,Wayne S. DeSarbo,2016 Various research areas face the methodological problems presented by nonnegative integer count data drawn from heterogeneous populations We present a disaggregate negative binomial regression procedure for analysis of count data observed for a heterogeneous sample of cross sections possibly over some fixed time periods This procedure simultaneously pools or groups cross sections while estimating a separate negative binomial regression model for each group An E M algorithm is described within a maximum likelihood framework to estimate the group proportions the group specific regression coefficients and the degree of overdispersion in event rates within each derived group The proposed procedure is illustrated with count data entailing nonnegative integer counts of purchases events for a frequently bought consumer good *Consistency for the Negative Binomial Regression with Fixed Covariate* Rafael Weißbach,Lucas Radloff,2018 *Consistency for the Negative Binomial Regression with Fixed Covariate* Rafael Weißbach,Lucas Radloff,2018 Negative Binomial Regression for Analysis of Aggregated Morbidity Data Dorte Kronberg,Søren Tolver Jensen,Anne K. MES,1997 **Poisson Versus Negative Binomial Regression in the Analysis of Count Data** Barbie Ann L. Bugna,2015 Commonly used tests for treatment effect in kx2 frequency data are Poisson regression negative binomial regression and Cochran Mantel Haentzel In practice Poisson regression or CMH is used as default and NB regression is used only when there is reason to believe the data has overdispersion beyond what is expected of Poisson counts We show that the Poisson regression is sensitive to the Poisson assumption and does not maintain its size in the presence of overdispersion In particular it tends to interpret overdispersion as significant treatment effect Thus there is a need for a reliable pretest for the Poisson assumption A commonly used diagnostic for overdispersion is a Wald test of the estimated overdispersion parameter however this has convergence problems We propose a simpler Hogg type diagnostic that has no convergence problems and is easy to compute

The Relative Performance of Poisson and Negative Binomial Regression Estimators McKinley L. Blackburn,2015 Negative binomial estimators are commonly used in estimating models with count data dependent variables In this paper sampling experiments are used to evaluate the performance of these estimators relative to the simpler Poisson estimator in finite

sample situations The results do not suggest a clear preference for negative binomial estimators in situations in which the underlying dependent variables are overdispersed unless the researcher is comfortable in assumptions about the precise form of the overdispersion *Econometric Analysis of Health Data* Andrew M. Jones,Owen O'Donnell,2002-05-17 Given extensive use of individual level data in Health Economics it has become increasingly important to understand the microeconometric techniques available to applied researchers The purpose of this book is to give readers convenient access to a collection of recent contributions that contain innovative applications of microeconometric methods to data on health and health care Contributions are selected from papers presented at the European Workshops on Econometrics and Health Economics and published in Health Economics Topics covered include Latent Variables Unobservable heterogeneity and selection problems Count data and survival analysis Flexible and semiparametric estimators for limited dependent variables Classical and simulation methods for panel data Publication marks the tenth anniversary of the Workshop series Doctoral students and researchers in health economics and microeconomics will find this book invaluable Researchers in related fields such as labour economics and biostatistics will also find the content of use *Applied Survey Data Analysis* Brady T. Mohammad Ahsanullah,2003 Mathematicians and statisticians from North America Europe Asia and the Middle East synthesize the recent literature on statistical methods Their topics include a family of estimators for the coefficient of determination in linear regression models the quasi random sequences in the random processes modeling algorithms locating a change point in a Gaussian model when an outlier is present the classical and Bayesian reliability estimation of the negative binomial distribution a shrinkage estimation of the exponential reliability with censored data and optimal equivariant vector prediction in location families Annotation 2004 Book News Inc Portland OR booknews com **Power and Sample Size Calculation in a Negative Binomial Regression Framework** William Aeberhard,2010 Functional Form and Heterogeneity in Models for Count Data William Greene,2007 This study presents several extensions of the most familiar models for count data the Poisson and negative binomial models We develop an encompassing model for two well known variants of the negative binomial model the NB1 and NB2 forms We then analyze some alternative approaches to the standard log gamma model for introducing heterogeneity into the loglinear conditional means for these models The lognormal model provides a versatile alternative specification that is more flexible and more natural than the log gamma form and provides a platform for several two part extensions including zero inflation hurdle and sample selection models We briefly present some alternative approaches to modeling heterogeneity We also resolve some features in Hausman Hall and Griliches 1984 Economic models for count data with an application to the patents R D relationship Econometrica 52 909 938 widely used panel data treatments for the Poisson and negative binomial models that appear to conflict with more familiar models of fixed and random effects Finally we consider a bivariate Poisson model that is also based on the lognormal heterogeneity model Two recent applications have used this model We suggest that the correlation estimated in their model frameworks is an ambiguous measure of the correlation of the variables of interest and may substantially overstate it We conclude with a detailed application of the proposed methods using the data employed in one of the two aforementioned bivariate Poisson studies **Asymptotic Covariances for the Maximum Likelihood Estimators of the Parameters of a Negative Binomial Distribution** Kimiko Osada Bowman,L. Shenton,1965 On Estimation and Influence Diagnostics for Zero-inflated Negative Binomial Regression Models ,2010 Community Series in Mental Illness, Culture, and Society: Dealing with the COVID-19 Pandemic, volume VIII Mohammadreza Shalbafan,Samer El Hayek ,Renato de Filippis,2024-06-21 The COVID 19 outbreak has impacted many areas of our lives including mental health Lockdown and physical distancing measures have been one major effective intervention to counter the spread of the virus and reduce the impact of the disease However they have negatively impacted mental well being and behaviors either triggering the onset of new psychiatric symptoms and diseases or amplifying pre existing ones The pandemic and lockdown measures have also been associated with reduced access to treatment and facilities all over the world further worsening mental health outcomes The impact on mental health although universal varied between nations Cultural and societal variables including norms values religion and stigma

have played an important role in shaping COVID 19 related mental health symptoms including anxiety depression grief psychosis and addiction These sociocultural factors have also molded how mental health interventions are tailored and provided Highlighting the intertwining relationship between the pandemic mental health and sociocultural factors are essential to managing emerging mental health symptoms adequately **Regression Models for Categorical and Count Data** Peter Martin,2022-03-01 This text provides practical guidance on conducting regression analysis on categorical and count data Step by step and supported by lots of helpful graphs it covers both the theoretical underpinnings of these methods as well as their application giving you the skills needed to apply them to your own research It offers guidance on Using logistic regression models for binary ordinal and multinomial outcomes Applying count regression including Poisson negative binomial and zero inflated models Choosing the most appropriate model to use for your research The general principles of good statistical modelling in practice Part of The SAGE Quantitative Research Kit this book will give you the know how and confidence needed to succeed on your quantitative research journey Accounting for Excess Zeros and Sample Selection in Poisson and Negative Binomial Regression Models William H. Greene,2008 We present several modifications of the Poisson and negative binomial models for count data to accommodate cases in which the number of zeros in the data exceed what would typically be predicted by either model The excess zeros can masquerade as overdispersion We present a new test procedure for distinguishing between zero inflation and overdispersion We also develop a model for sample selection which is analogous to the Heckman style specification for continuous choice models An application is presented to a data set on consumer loan behavior in which both of these phenomena are clearly present
