Miyan, 2015-06-12 Brain immune interactions are essential to maintain health and their dysfunction contributes to diverse human diseases Recent data show that haematopoietic processes and immune organs are under central autonomic control Deficient regulation of inflammatory events contributes to brain diseases whereas acute or chronic brain injury is linked with the development of systemic inflammatory conditions or immunosuppression At present common disorders with high socio economic burden such as cancer cardiovascular neuroinflammatory and neurodegenerative diseases asthma allergies autism psychiatric conditions and sepsis are believed to

be influenced at least in part by the dysfunction of brain immune communication. Since the median age of the world's population is increasing rapidly, it is expected that the burden of common non-communicable diseases will further increase, which represents a huge challenge to the health care systems worldwide. Thus, there is an increasing demand to understand and treat complex diseases, many of which are age-related, and this is not possible unless the fine-tuned communication between large systems such as the nervous and the immune system is comprehensively understood. Although it is impossible to cover all areas of relevant research in this field, papers in this eBook give some insight into a few important aspects of brain immune interactions and their contribution to disease. We hope that this collection could stimulate further relevant research and facilitate discussions to support the understanding of the highly complex interactions between the immune system and the brain in health and disease.

Neuro-Immune Interactions in Inflammation and Autoimmunity Valentin A. Pavlov, Niccolò Terrando, 2018-07-24

The nervous system plays an important role in the regulation of immunity and inflammation. On the other hand, unbalanced immune responses in inflammatory and autoimmune conditions may have a deleterious impact on neuronal integrity and brain function. Recent studies have characterized neural pathways communicating peripheral inflammatory signals to the CNS, and brain and spinal cord-derived circuitries controlling various innate and adaptive immune responses and inflammation. A prototypical neural reflex circuit that regulates immunity and inflammation is the vagus nerve-based inflammatory reflex. Ongoing research has revealed cellular and molecular mechanisms underlying these neural circuits and indicated new therapeutic approaches in inflammatory and autoimmune disorders. Pharmacological and bioelectronic modulation of neural circuitry has been successfully explored in preclinical settings of sepsis, arthritis, inflammatory bowel disease, obesity-driven disorders, diabetes, and other diseases. These studies paved the way to successful clinical trials with bioelectronic neuronal modulation in rheumatoid arthritis and inflammatory bowel disease. Dysregulated release of cytokines and other inflammatory molecules may have a severe impact on brain function. Brain inflammation, neuroinflammation, imbalances in brain neuronal integrity and neurotransmitter systems, and cognitive impairment are characteristic features of post-operative conditions, sepsis, liver diseases, diabetes, and other disorders characterized by immune and metabolic dysregulation. Derangements in cytokine release also play a pivotal role in depression. Characteristic brain-reactive antibodies in autoimmune conditions, including systemic lupus erythematosus and neuromyelitis optica, significantly contribute to brain pathology and cognitive impairment. These studies and the simultaneous characterization of neuro-protective cytokines identified new therapeutic approaches for treating neurological complications in inflammatory and autoimmune disorders. This Frontiers Research Topic is a forum for publishing research findings and methodological and conceptual advances at the intersection of immunology and neuroscience. We hope that presenting new insight into bidirectional neuro-immune communication in inflammation and autoimmunity will foster further collaborations and facilitate the development of new efficient therapeutic strategies.

Neuroendocrine-Immune System Interactions Jan Pieter

Konsman, Teresa M. Reyes, 2023-03-03 The concepts of the neuroendocrine system and the immune system emerged more or less simultaneously in the second half of the 20th century. Although these systems have a high degree of autonomy, it has also become clear that they interact in many ways and at different levels. This book focuses on the neuroendocrine and immune interactions that are fundamental to normal development and maintenance of health. The first introductory chapters are devoted to the historical and philosophical concepts within the field as well as evolutionary considerations offering critical interdisciplinary perspectives on the development of this field of research. Without attempting an exhaustive overview, the book then introduces some of the regulatory pathways that mediate interactions between the neuroendocrine and immune systems and examines modulating factors such as age and sex. In addition, several chapters address the importance of neuroendocrine-immune interactions in some disease states. Readers can expect to gain a broad perspective of neuroendocrine-immune interactions in development, health, and disease along with a critical evaluation of current methods used in the field. Given its scope, the book is essential reading for undergraduate and graduate students with an interest in neuroendocrinology, neuroimmunology, and neuroscience as well as postdoctoral fellows and established researchers seeking a comprehensive overview and historical perspective of the field of neuroendocrine-immune interactions.

Understanding Crohn's Disease: Immunity, Genes and Microbes Amélia Sarmiento, Fernando Magro, Nair Campos, 2017-08-11 Crohn's disease (CD) is a chronic relapsing inflammatory bowel disease resulting in considerable morbidity and reduced quality of life. Although still under intense debate, CD seems to result from an enhanced and uncontrolled immune response to the gut microbiota. CD is thought to be multifactorial, depending on genetic and environmental determinants. In recent years, nearly 100 single nucleotide polymorphisms (SNPs) were associated with increased risk of developing CD; some of the SNPs also associated with susceptibility to ulcerative colitis, another type of IBD. These SNPs are mostly located in genes involved in innate and adaptive immunity mechanisms such as autophagy, expression of pattern recognition receptors, and cytokine signaling. Epigenetics is also probably playing a role in CD susceptibility as it is sensitive to environmental conditions and may mediate gene-environment interactions. Environmental factors possibly involved in CD development include diet, gut microbiota composition, and infection with specific pathogens, of which the most consistently associated to CD are *Mycobacterium avium* subsp. *paratuberculosis* and adherent-invasive *Escherichia coli*. This topic aimed at bringing together contributions covering different genetic, epigenetic, immunological, and microbial processes involved in the development of CD, helping to drive forward the understanding of CD immunopathology.

Immune and Inflammatory Responses in the Nervous System Nancy Rothwell, Sarah Loddick, 2002 This new edition covers recent advances in understanding immunological and inflammatory responses in the nervous system, research driven by the potential to use knowledge of the molecules and mechanisms involved to intervene in and arrest neurodegenerative disease processes. Immune and Inflammatory Responses in the Nervous System covers developmental aspects of immune/inflammatory responses in the CNS, basic aspects of glial function, as well as inflammatory mediators, their mechanisms of action, clinical importance, and sites of infection. There is also coverage of the major diseases of the CNS, including stroke, brain injury, multiple sclerosis, and Alzheimer's disease. Throughout, the focus is on the underlying basic neuroscience, clinical relevance, and the potential for therapeutic interventions. This will be an invaluable aid to understanding and improving the diagnosis of neuroimmune diseases and determining therapeutic measures. The contributors are all leading experts in the field, and the content will be of interest to neuroscientists, neurologists, neuropathologists, neurosurgeons, and immunologists.

Psychoneuroimmunology Robert Ader, David L. Felten, Nicholas Cohen, 2001 Psychoneuroimmunology is the study of interactions among behavioral, neural, and endocrine and immunologic processes of adaptation. These two volumes provide a clearly written, extensively referenced summary of some of the behavioral, neural, and endocrine regulators of immune responses and immunologically mediated disease processes, and of the behavioral and neuroendocrine effects of immune system activity. Several chapters expand upon topics reviewed in earlier editions of this series; most chapters cover active areas of research that have not previously been reviewed. As illustrated in this fourth edition, interdisciplinary research continues to provide evidence that the brain and immune system represent a single, integrated system of defense. Fully revised and updated fourth edition of the classic reference. Provides a neuroendocrine and immunologic perspective for the behavioral scientist.
