Network flows and network design in theory and practice Jannik Matuschke,2014 Network flow and network design problems arise in various application areas of combinatorial optimization e g in transportation production or telecommunication This thesis contributes new results to four different problem classes from this area providing models and algorithms with immediate practical impact as well as theoretical insights into complexity and combinatorial structure of network optimization problems i We introduce a new model for tactical transportation planning that employs a cyclic network expansion to integrate routing and inventory decisions into a unified capacitated network design formulation We also devise several algorithmic approaches to solve the resulting optimization problem and demonstrate the applicability of our approach on a set of real world logistic networks ii We present approximation algorithms for combined location and network design problems including the first constant factor approximation for capacitated location routing iii We derive a max flow min cut theorem for abstract flows over time a generalization of the well known work of Ford and Fulkerson that restricts to a minimal set of structural requirements iv We devise algorithms for finding orientations of embedded graphs with degree constraints on vertices and faces answering an open question by Frank

Multicommodity and Generalized Flow Algorithms Jeffrey David Oldham, 1999

Abstract We present several simple practical and fast algorithms for linear programs concentrating on network flow problems Since the late 1980s researchers developed different combinatorial approximation algorithms for fractional packing problems obtaining the fastest theoretical running times to solve multicommodity minimum cost and concurrent flow problems A direct implementation of these multicommodity flow algorithms was several orders of magnitude slower than solving these problems using a commercial linear programming solver Through experimentation we determined which theoretically equivalent constructs are experimentally efficient Guided by theory we designed and implemented practical improvements while maintaining the same worst case complexity bounds The resulting algorithms solve problems orders of magnitude faster than commercial linear programming solvers and problems an order of magnitude larger We also present simple combinatorial algorithms for generalized flow problems These problems generalize ordinary network flow problems by specifying a flow multiplier μ_a for each arc a Using multipliers permit a flow problem to model transforming one type into another e.g. currency exchange and modification of the amount of flow e.g. water evaporation from canals or accrual of interest in bank accounts First we show the generalized shortest paths problem can be solved using existing network flow ideas i.e. by combining the Bellman Ford Moore shortest path framework and Megiddo's parametric search Second we combine this algorithm with fractional packing frameworks to yield the first polynomial time combinatorial approximation algorithms for the generalized versions of the nonnegative cost minimum cost flow concurrent flow multicommodity maximum flow and multicommodity nonnegative cost minimum cost flow problems These algorithms show that generalized concurrent flow and multicommodity maximum flow have strongly polynomial approximation algorithms
