Guide to Reliable Internet Services and Applications Charles R. Kalmanek, Sudip Misra, Yang (Richard) Yang, 2010-06-09. An oft-repeated adage among telecommunication providers goes: There are three things that matter: reliability, reliability, reliability; time to market and cost. If you can't do all three, at least do the first three. Yet designing and operating reliable networks and services is a Herculean task. Building truly reliable components is unacceptably expensive, forcing us to construct reliable systems out of unreliable components. The resulting systems are inherently complex, consisting of many different kinds of components running a variety of different protocols that interact in subtle ways. Inter-networks such as the Internet span multiple regions of administrative control, from campus and corporate networks to Internet Service Providers, making good end-to-end performance a shared responsibility borne by sometimes uncooperative parties. Moreover, these networks consist not only of routers but also lower-layer devices such as optical switches and higher-layer components such as firewalls and proxies. And these components are highly configurable, leaving ample room for operator error and buggy software. As if that were not difficult enough, end users understandably care about the performance of their higher-level applications, which has a complicated relationship with the behavior of the underlying network. Despite these challenges, researchers and practitioners alike have made tremendous strides in improving the reliability of modern networks and services.
