such price, we get the quantity supplied by the firm as Q_1 by multiplying the quantity supplied by the typical firm (here the individual supply curve) by 100. At a price of \$1, such firm produces 6 units (point A) as the market supply (with all firms) is 100 units (point B). If the price increases to \$1.1, such firm increases production to 6.4 units (point A), so the market supply is 104 units (point C) (Figure 8).

What happens if there are not identical but instead have different individual supply curves? To compute the market supply in this case, we add the quantities supplied by the hundreds of firms in the market. The assumption that firms are identical is however it makes it easier to derive the market supply curve from the supply curve of the typical firm, but it has no change the analysis.

Market Equilibrium

Figure 9.1 shows a perfectly competitive market in equilibrium. For a short-run equilibrium, two conditions are satisfied:

Figure 9.1

Market Equilibrium

In Figure 9.1, the market demand curve represents the short-run aggregate demand in a perfectly competitive market (point A). The supply curve shows the aggregate supply of perfectly price elastic firms (point B). The price at which the aggregate demand and supply intersect is \$10 per unit. \$10 is also the average cost of the maximum economic efficiency with a firm, and no other firms enter the market.

- At the market level, the quantity of the product supplied equals the quantity demanded. The demand curve intersects the short-run market supply curve at a price of \$10 and a quantity of 100 units per minute (Point A).
- The supply curve in the market continues to provide given the market price. Given the market price of \$10, each of the 100 firms maximizes profit by producing 100 units per minute (Point B).

Macroeconomics Robert J. Gordon, 2013-07-19. Macroeconomics is widely praised for its ability to present theory as a way of evaluating key macro questions such as why some countries are rich and others are poor. Students have a natural interest in what is happening today and what will happen in the near future. Macroeconomics capitalizes on their interest by beginning with business cycles and monetary/fiscal policy in both closed and open economy. After that, Gordon presents a unique dynamic analysis of demand and supply shocks as causes of inflation and unemployment, followed by a dual approach to economic growth in which theory and real world examples are used to compare rich and poor countries.
