Hill, 2009 An introduction to the principles of unified georeferencing which uses placename and geospatial referencing interchangeably across all types of information storage and retrieval systems Georeferencing relating information to geographic location has

been incorporated into today's information systems in various ways. We use online services to map our route from one place to another. Science, business, and government increasingly use geographic information systems (GIS) to hold and analyze data. Most georeferenced information searches using today's information systems are done by text query. But text searches for placenames fall short when, for example, a place is known by several names or by none. In addition, text searches don't cover all sources of geographic data. Maps are traditionally accessed only through special indexes, filing systems, and agency contacts. Data from remote sensing images or aerial photography is indexed by geospatial location, mathematical coordinates such as longitude and latitude. In this book, Linda Hill describes the advantages of integrating placename-based and geospatial referencing, introducing an approach to unified georeferencing that uses placename and geospatial referencing interchangeably across all types of information storage and retrieval systems. After a brief overview of relevant material from cognitive psychology on how humans perceive and respond to geographic space, Hill introduces the reader to basic information about geospatial information objects, concepts of geospatial referencing, the role of gazetteer data, the ways in which geospatial referencing has been included in metadata structures, and methods for the implementation of geographic information retrieval. *GIR: Georeferencing* will be a valuable reference for librarians, archivists, scientific data managers, information managers, designers of online services, and any information professional who deals with place-based information.

**Middleware 2004** Hans-Arno Jacobsen, 2004-12-27 Middleware systems comprise programming models abstractions protocols and services to facilitate the design the development the integration and the ployment of distributed applications in heterogeneous computing environments Conceptually the term middleware refers to a layer of software above the networking substrate and the operating system and below the distributed application In practice these boundaries are not clear cut with middleware functionality moving into and out of these layers Remote communication p lish subscribe

messaging and distributed transaction constitute examples of common middleware abstractions and services. Middleware research encompasses builds on and extends a wide spectrum of concepts, techniques, and ideas from a broad range of fields including programming languages, distributed systems, operating systems, networking, and data management. Following the success of the past conferences in this series in the Lake District UK 1998, in Palisades NY 2000, in Heidelberg Germany 2001, and in Rio de Janeiro Brazil 2003, the 5th International Middleware Conference in Toronto Canada aimed to be the premier conference for middleware research and technology in 2004. The broad scope of the conference included the design, the implementation, the deployment, and the evaluation of distributed systems, platforms, and architectures for emerging computing environments. The conference gave an overview of research on middleware for peer-to-peer computing, middleware for mobility, middleware for replication and transactions on publish-subscribe systems, on routing protocols and overlay networks, on application servers, resource management and software engineering, and on Web services. This year the technical program of Middleware drew from 194 submitted papers, among which 13 were explicitly submitted as work-in-progress papers.
