Prudhomme,2005 **Image Analysis** ,2005 **Review of Bayer Pattern Color Filter Array (CFA) Demosaicing with New Quality Assessment Algorithms** ,2010 To address the frequent lack of a reference image or ground truth when performance testing Bayer pattern color filter array CFA demosaicing algorithms we propose two new no reference quality assessment algorithms These new algorithms give a relative comparison of two demosaicing algorithms by measuring the presence of two common artifacts in their output images For this purpose we reviewed various demosaicing algorithms especially adaptive color plane gradient based methods and median filtering paying particular attention to the false color and edge blurring artifacts common to all demosaicing algorithms We also reviewed classic quality assessment methods that require a reference image MSE PSNR and deltaE characterized their typical usage and identified their associated pitfalls With this information in mind the motivations for no reference quality assessment are discussed From that we designed new quality assessment algorithms to compare two images demosaiced from the same CFA data by measuring the sharpness of the edges and determining the presence of false colors Using these new algorithms we evaluated and ranked the previously described demosaicing algorithms We reviewed a large quantity of real images which were used to justify the rankings suggested by the new quality assessment algorithms This work provides a path forward for future research investigating possible relationships between CFA demosaicing and color image super resolution Proceedings ,2003 **Computational Science - ICCS ...** ,2003 **Optical Engineering** ,2005 Publishes papers reporting on research and development in optical science and engineering and the practical applications of known optical science engineering and technology Advances in Multimedia Information Processing-PCM ... ,2005 Proceedings of ... International Conference on Information, Communications, and Signal Processing ,2003 Denoising and Demosaicking of Color Images Mina Rafi Nazari,2017 Most digital cameras capture images through Color Filter Arrays CFA and reconstruct the full color image from the CFA image Each CFA pixel only captures one primary color component at each pixel location the other primary components will be estimated using information from neighboring pixels During the demosaicking algorithm the unknown color components will be estimated at each pixel location Most of the demosaicking algorithms use the RGB Bayer CFA pattern with Red Green and Blue filters Some other CFAs contain four color filters The additional filter is a panchromatic white filter and it usually receives the full light spectrum In this research we studied and compared different four channel CFAs with panchromatic white filter and compared them with three channel CFAs An appropriate demosaicking algorithm has been developed for each CFA The most well known three channel CFA is Bayer The Fujifilm X Trans pattern has been studied in this work as another three channel CFA with a different structure Three different four channel CFAs have been discussed in this research RGBW Kodak RGBW Bayer and RGBW 5 times 5 The structure and the number of filters for each color are different for these CFAs Since the Least

Square Luma Chroma Demultiplexing method is a state of the art demosaicking method for the Bayer CFA we designed the Least Square method for RGBW CFAs The effect of noise on different CFA patterns will be discussed for four channel CFAs The Kodak database has been used to evaluate our non adaptive and adaptive demosaicking methods as well as the optimized algorithms with the least square method The captured values of white panchromatic clear filters in RGBW CFAs have been estimated using red green and blue filter values Sets of optimized coefficients have been proposed to estimate the white filter values accurately The results have been validated using the actual white values of a hyperspectral image dataset A new denoising demosaicking method for RGBW Bayer CFA has been presented in this research The algorithm has been tested on the Kodak dataset using the estimated value of white filters and a hyperspectral image dataset using the actual value of white filters and the results have been compared The results in both cases have been compared with the previous works on RGB Bayer CFA and it shows that the proposed algorithm using RGBW Bayer CFA is working better than RGB Bayer CFA in presence of noise

Interpolation Methods for the Bayer Color Array, 2000 Digital still color cameras working on single CCD based systems have a mosaicked mask of color filters on the sensors The Bayer array configuration for the filters is popularly used This requires that the data be interpolated to recover all the scene information Many existing interpolation demosaicking algorithms that can reconstruct the scene use modifications of the bilinear interpolation method introducing a variety of artifacts in the images These algorithms have been investigated A new method for restoring these color images using an optimization method known as Mean Field Annealing is introduced using a variety of image prior models Their performance relative to existing demosaicking methods is included
