Computational Methods for the Analysis of Next

Generation Sequencing Data Wei Wang,2014 Recently next generation sequencing NGS technology has emerged as a powerful approach and dramatically transformed biomedical research in an unprecedented scale NGS is expected to replace the traditional hybridization based microarray technology because of its affordable cost and high digital resolution Although NGS has significantly extended the ability to study the human genome and to better understand the biology of genomes the new technology has required profound changes to the data analysis There is a substantial need for computational methods that allow a convenient analysis of these overwhelmingly high throughput data sets and address an increasing number of compelling biological questions which are now approachable by NGS technology This dissertation focuses on the development of computational methods for NGS data analyses First two methods are developed and implemented for detecting variants in analysis of individual or pooled DNA sequencing data SNVer formulates variant calling as a hypothesis testing problem and employs a binomial binomial model to test the significance of observed allele frequency by taking account of sequencing error SNVerGUI is a GUI based desktop tool that is built upon the SNVer model to facilitate the main users of NGS data such as biologists geneticists and clinicians who often lack of the programming expertise Second

collapsing singletons strategy is explored for associating rare variants in a DNA sequencing study. Specifically a gene based genome wide scan based on singleton collapsing is performed to analyze a whole genome sequencing data set suggesting that collapsing singletons may boost signals for association studies of rare variants in sequencing study. Third two approaches are proposed to address the 3' UTR switching problem. PolyASeeker is a novel bioinformatics pipeline for identifying polyadenylation cleavage sites from RNA sequencing data which helps to enhance the knowledge of alternative polyadenylation mechanisms and their roles in gene regulation. A change point model based on a likelihood ratio test is also proposed to solve such problem in analysis of RNA sequencing data. To date this is the first method for detecting 3' UTR switching without relying on any prior knowledge of polyadenylation cleavage sites. **Bioinformatics** Hamid D. Ismail, 2023-06-29

Genomic and Functional Analysis of Next-generation Sequencing Data, 2012 Advances in next generation sequencing (NGS) technologies have resulted in significant reduction of cost per sequenced base pair and increase in sequence data volume. On the other hand, most currently used NGS technologies produce relatively short sequence reads (50–150 bp) compared to Sanger sequencing (700 bp). This represents an additional challenge in data analysis because shorter reads are more difficult to assemble. At this point, production of sequencing data outpaces our capacity to analyze them. Newer NGS technologies capable of producing longer reads are emerging, which should simplify and speed up genome assembly. However, this will only increase the number of sequenced genomes without structural and functional annotation. In addition to multiple scientific initiatives to sequence thousands of genomes, personalized medicine centered on sequencing and analysis of individual human genomes will become more available. This poses a challenge for computer science and emphasizes the importance of developing new computational algorithms, methodology, tools, and pipelines. This dissertation focuses on development of these software tools, methodologies, and resources to help address the need for processing of volumes of data generated by new sequencing technologies. The research concentrated on genome structure analysis, individual variation, and comparative biology. This dissertation presents:

1. the Short Read Classification Pipeline (SRCP) for preliminary genome characterization of unsequenced genomes;
2. a novel methodology for phylogenetic analysis of closely related organisms or strains of the same organism without a sequenced genome;
3. a centralized online resource for standardized gene nomenclature. Utilizing the SRCP and the methodology for initial phylogenetic analysis developed in this dissertation enables positioning the organism in the evolutionary context. This should facilitate identification of orthologs between the species and paralogs within the species, even in the initial stage of the analysis when only exome is sequenced and thus enable functional annotation by transferring gene nomenclature from well-annotated 1:1 orthologs as required by the online standardized gene nomenclature resource developed in this dissertation.

Thus, the tools, methodology, and resources presented here are tied together in following the initial analysis workflow for structural and functional annotation.
