**Agent-Based Modeling of Environmental Conflict and Cooperation** Todd BenDor, Jürgen Scheffran, 2018-10-12 Conflict is a major facet of many environmental challenges of our time. However growing conflict complexity makes it more difficult to identify win-win strategies for sustainable conflict resolution. Innovative methods are needed to help predict, understand and resolve conflicts in cooperative ways. Agent-Based Modeling of Environmental Conflict and Cooperation examines computer modeling techniques as an important set of tools for assessing environmental and resource-based conflicts and ultimately for finding pathways to conflict resolution and cooperation. This book has two major goals. First, it argues that complexity science can be a unifying framework for professions engaged in conflict studies and resolution, including anthropology, law, management, peace studies, urban planning, and geography. Second, this book presents an innovative framework for approaching conflicts as complex adaptive systems by using many forms of environmental analysis, including system dynamics modeling, agent-based modeling, evolutionary game theory, viability theory, and network analysis. Known as VIABLE Values and Investments from Agent-Based Interaction and Learning in Environmental systems, this framework allows users to model advanced facets of conflicts, including institution building, coalition formation, adaptive learning, and the potential for future conflict and conflict resolution, based on the long-term viability of the actors' strategies. Written for scholars, students, practitioners, and policy makers alike, this book offers readers an extensive introduction to environmental conflict research and resolution techniques. As the result of decades of research, the text presents a strong argument for conflict modeling and reviews the most popular and advanced techniques, including system dynamics modeling, agent-based modeling, and participatory modeling methods. This indispensable guide uses NetLogo, a widely used and free modeling software package, to implement the VIABLE modeling approach in three case study applications around the world. Readers are invited to explore, adapt, modify, and expand these models to conflicts they hope to better understand and resolve.

Annual Report Bāmlādeśa Pallī Unnayana Ekādemī, 2014 Natural History Ross J. Wilson, 2017-08-07 The concept of natural heritage has become increasingly significant with the threat of dwindling resources, environmental degradation and climatic change. As humanity's impact on the condition of life on earth has become more prominent, a discernible shift in the relationship between western society and the environment has taken place. This is reflective of wider historical processes which reveal a constantly changing association between humanity's definition and perception of what nature constitutes or what can be defined as natural. From the ornate collections of specimens which formed the basis of a distinct concept of

nature emerging during the Enlightenment this definition and the wider relationship between humanity and natural history have reflected issues of identity place and politics in the modern era This book examines this process and focuses on the ideas values and agendas that have defined the representation and reception of the history of the natural world including geology and palaeontology within contemporary society addressing how the heritage of natural history whether through museums parks tourist sites or popular culture is used to shape social political cultural and moral identities It will be of interest to scholars and practitioners within heritage studies public history ecology environmental studies and geography
