A New Unifying Biparametric Nomenclature that Spans all of Chemistry Seymour B. Elk, 2004-05-20 As a byproduct of historical development there are different unrelated systems of nomenclature for inorganic chemistry organic chemistry polymer chemistry natural products chemistry etc With each new discovery in the laboratory as well as each new theoretical proposal for a chemical the lines that traditionally have separated these distinct subsets of matter continually grow more blurred This lack of uniformity in characterizing and naming chemicals increases the communication difficulties between differently trained chemists as well as other scientists and greatly impedes progress With the set of known chemicals numbering over 42 000 000 in Chemical Abstracts data base and continually growing about 2 000 new additions every day the desirability for a unified system for naming all chemicals simultaneously grows Moreover in order to meet the requirements of disparate groups of scientists and of society in general the name assigned to a given chemical should not only uniquely describe that substance but also should be a part of a readily recognizable order for the entire field For these purposes a topology based bi parametric system of nomenclature is herein proposed In this book a new nomenclature system is proposed The new nomenclature is applicable to a three dimensional world and is internally consistent This nomenclature

unifies ALL branches of chemistry removing the need for various presently existing sets of rules

Chemical Nomenclature K J Thurlow, 1999-01-31

Chemical nomenclature can be a complicated subject. As a result, most works on the subject are rather dry textbooks and primarily consist of sets of instructions on how to name chemicals. This practical book proves that chemical nomenclature can be interesting, not just a necessary evil. Written in a lively and engaging style by experts in their particular fields, this new book provides a general discussion on why good, clear nomenclature is needed. It introduces the reader to the various forms of nomenclature without reading like a textbook. Both systematic and trivial nomenclature systems are used widely and interchangeably in chemistry, and this new book covers both areas. For example, systematic nomenclature in both the CAS and IUPAC styles is introduced. These systems have many similarities but important differences which the chemist should be aware of. Specialized naming systems are needed for polymers and natural products, and these areas are covered in separate chapters. The naming of elements is a very topical subject at the moment, and so this is included to ensure comprehensive coverage. Covering a wide range of topics in the area of nomenclature and acting as an introduction to a varied field, this book will be of interest to industrial chemists as well as students at senior undergraduate and postgraduate level.
