Nature Inspired Metaheuristic Optimization Algorithms and Applications

Samuel Gaxiola,2020 Regarding optimization methods there is much inspiration to be found in nature and biology There has been much effort in recent years to further and develop new methods and algorithms for approaching optimization problems with the inspiration for the logic for these algorithms coming from biology and nature in general Broadly speaking there are three categories of algorithms with respect to the logical structures Swarm intelligence algorithms operate with a logic that utilizes multiple instances in the search space to find an optimal solution by emulating the way lifeforms search for food or shelter in swarms Evolutionary algorithms operate in such a way that an initial set of instances referred to as the initial population will have certain characteristics used to measure fitness which are then passed on to the subsequent offspring instances in each iteration of the algorithm until some predetermined stop condition is met Population based stochastic algorithms utilize an element of randomness when creating instances and analyzing the search space which make the logic less susceptible to converging to an undesirable solution Because these categories are so broad in their definitions and characteristics there are many algorithms that fall within multiple categories In this work three algorithms are analyzed and characterized The Invasive Weed Optimization IWO algorithm utilizes the concept of unwanted weeds in a garden spreading and serves as the basis for a population based stochastic algorithm The Imperialist Competitive Algorithm ICA emulates the observed relationships between imperialist and colony states in history and utilizes a logic that encapsulates some features of evolutionary algorithms while also being stochastic and population based A hybrid algorithm comprised of population based stochastic characteristics taken from the IWO and swarm intelligence from the Particle Swarm Optimization PSO algorithm provides a more comprehensive and robust method of traversing the search space benefiting from the strengths of both algorithms These algorithms were characterized using benchmark test functions They
