Mitra, 2013-04-17 This book is an account of the manner in which the optical phenomena observed from solids relate to their fundamental properties Written at the graduate level it attempts a threefold purpose an indication of the breadth of the subject an in depth examination of important areas and a text for a two semester course The first two chapters present introductory theory as a foundation for subsequent reading The following ten chapters broadly concern electronic properties associated with semiconductors ranging from narrow to wide energy gap materials

Lattice properties are examined in the remaining chapters in which effects governed by phonons in perfect crystals point defects their vibrational and electronic spectra and electron phonon interactions are stressed Fun and hard work both in considerable measure have gone into the preparation of this volume At the University of Freiburg W Germany from August 7 20 1966 the occasion of a NATO Advanced Study Institute on The Optical Properties of Solids the authors of these various chapters lectured for the Institute this volume provides essentially the Proceedings of that meeting Many major revisions of original lectures contractions and enlargements were required for better organization and presentation of the subject matter Several abbreviated chapters appear mainly to indicate the importance of their contents in optical properties research and to indicate recently published books that provide ample coverage We are indebted to many people the authors for their efforts and patience our host at the University of Freiburg the late Professor Dr
