Current Medical Diagnosis & Treatment 2007 Stephen J. McPhee, Maxine A. Papadakis, Lawrence M. Tierney, 2006-10 Now celebrating 46 years this resource delivers the most reliable up to date coverage of more than 1 000 common diseases and disorders along with a clear synopsis of treatment and diagnosis DNA Vaccination/Genetic Vaccination Hilary Koprowski, David B. Weiner, 1997-12-11 Genetic DNA immunization represents a novel approach to vaccine and immune therapeutic development The direct injection of nucleic acid expression cassettes into a living host results in a limited number of its cells becoming factories for production of the introduced gene products This host inappropriate gene expression has important immunological consequences resulting in the specific immune activation of the host against the gene delivered antigen The recent demonstration by a number of laboratories that the induced immune responses are functional in experimental models against both specific infectious diseases and cancers is likely to have dramatic

consequences for the development of a new generation of experimental vaccines and immune therapies. This technology has the potential to enable the production of vaccines and immune-based therapies that are not only effective immunologically but are accessible to the entire world rather than just to the most developed nations. Vaccine Development. Vaccination against pathogenic microorganisms represents one of the most important advances in the history of medicine. Vaccines including those against polio, measles, mumps, rubella, hepatitis A, hepatitis B, pertussis, and other diseases have dramatically improved and protected more human lives than any other avenue of modern medicine. The vaccine against smallpox, for example, has been so successful that it is now widely believed that this malicious killer responsible for more deaths in the twentieth century than World Wars I and II combined has been removed from the face of the earth.
