Mining Of Massive Datasets:

Mining of Massive Datasets Jure Leskovec, Anand Rajaraman, Jeffrey David Ullman, 2014-11-13 Written by leading authorities in database and Web technologies this book is essential reading for students and practitioners alike The popularity of the Web and Internet commerce provides many extremely large datasets from which information can be gleaned by data mining This book focuses on practical algorithms that have been used to solve key problems in data mining and can be applied successfully to even the largest datasets It begins with a discussion of the map reduce framework an important tool for parallelizing algorithms automatically The authors explain the tricks of locality sensitive hashing and stream processing algorithms for mining data that arrives too fast for exhaustive processing Other chapters cover the PageRank idea and related tricks for organizing the Web the problems of finding frequent itemsets and clustering This second edition includes new and extended coverage on social networks machine learning and dimensionality reduction

Mining of Massive Datasets, Second Edition Jure Leskovec, 2014 **Mining of Massive Datasets** Din Wasem, 2014-11-03 Big data is a relative term describing a situation where the volume velocity and variety of data exceed an organization's storage or compute capacity for accurate and timely decision making Big data is not a single technology but a combination of old and new technologies that helps companies gain actionable insight Therefore big data is the capability to manage a huge volume of disparate data at the right speed and within the right time frame to allow real time analysis and reaction As we note earlier in this chapter big data is typically broken down by three characteristics Volume How much data Velocity How fast that data is processed Variety The various types of data Although it's convenient to simplify big data into the three Vs it can be misleading and overly simplistic For example you may be managing a relatively small amount of very disparate complex data or you may be processing a huge volume of very simple data That simple data may be all structured or all unstructured Even more important is the fourth V veracity How accurate is that data in predicting business value Do the results of a big data analysis actually make sense Determining relevant data is key to delivering value from massive amounts of data However big data is defined less by volume which is a constantly moving target than by its ever increasing variety velocity variability and complexity Compression Schemes for Mining Large Datasets T. Ravindra Babu, M. Narasimha Murty, S.V. Subrahmanya, 2013-11-19 This book addresses the challenges of data abstraction generation using a least number of database scans compressing data through novel lossy and non lossy schemes and carrying out clustering and classification directly in the compressed domain Schemes are presented which are shown to be efficient both in terms of space and time while simultaneously providing the same or better classification accuracy Features describes a non lossy compression scheme based on run length encoding of patterns with binary valued features proposes a lossy compression scheme that recognizes a pattern as a sequence of features and identifying subsequences examines whether the identification of prototypes and features can be achieved simultaneously through lossy compression and efficient clustering

discusses ways to make use of domain knowledge in generating abstraction reviews optimal prototype selection using genetic algorithms suggests possible ways of dealing with big data problems using multiagent systems

Multiscale and Multiresolution Methods Timothy J. Barth, Tony Chan, Robert Haimes, 2012-12-06 Many computationally challenging problems omnipresent in science and engineering exhibit multiscale phenomena so that the task of computing or even representing all scales of action is computationally very expensive unless the multiscale nature of these problems is exploited in a fundamental way Some diverse examples of practical interest include the computation of fluid turbulence structural analysis of composite materials terabyte data mining image processing and a multitude of others This book consists of both invited and contributed articles which address many facets of efficient multiscale representation and scientific computation from varied viewpoints such as hierarchical data representations multilevel algorithms algebraic homogenization and others This book should be of particular interest to readers interested in recent and emerging trends in multiscale and multiresolution computation with application to a wide range of practical problems
