A. Keith Thompson,1998 The transportation and storage of fresh fruit and vegetables is an international operation for which the available technology must be used to ensure that produce reaches the consumer in the best possible condition The use of controlled atmospheric conditions as a way of reducing the use of chemical preservatives and pesticides has great potential for the reduction of postharvest losses and the maintenance of nutritive value and organoleptic characteristics The proper application of controlled atmosphere storage is likely to have as great an impact as the introduction of refrigeration technology a century earlier yet its potential is only just becoming appreciated despite its use for apples for many years In this book the author reviews and condenses the large amount of research on controlled atmosphere storage going back more than 80 years in order to provide the most comprehensive reference source on this topic It traces the history of the technique and the range of conditions currently in use for different fruit and vegetables and their effect on flavor quality and physiology The influence of pests and diseases environmental factors such as mixtures of gases and packaging are then described and the recommended controlled atmosphere conditions for a wide range of crops is provided This book is essential reading for horticultural researchers and food industry staff concerned with transportation storage and quality In addition it is a valuable reference source for students of horticulture agriculture engineering food science and technology and food marketing as well as regulatory bodies and consumer groups *Fruit Processing* ,1995 *Use of Irradiation to Ensure the Hygienic Quality*
