Minimax Theory of Image Reconstruction Aleksandr Petrovich Korostelev, A. B. Tsybakov, 1993-01-01 *Minimax Theory of Image Reconstruction* A. P. Korostelev, A. B. Tsybakov, 1993-04-16 **Recent Advances and Trends in Nonparametric Statistics** M.G. Akritas, D.N. Politis, 2003-10-31 The advent of high speed affordable computers in the last two decades has given a new boost to the nonparametric way of thinking Classical nonparametric procedures such as function smoothing suddenly lost their abstract flavour as they became practically implementable In addition many previously unthinkable possibilities became mainstream prime examples include the bootstrap and resampling methods wavelets and nonlinear smoothers graphical methods data mining bioinformatics as well as the more recent algorithmic approaches such as bagging and boosting This volume is a collection of short articles most of which having a review component describing the state of the art of Nonparametric Statistics at the beginning of a new millennium Key features algorithmic approaches wavelets and nonlinear smoothers graphical methods and data mining biostatistics and bioinformatics bagging and boosting support vector machines resampling methods **Change-point Problems** Edward G. Carlstein, Hans-Georg Müller, David Siegmund, 1994 Journal of the American Statistical Association, 1998 *AMSTAT News*, 1994 Statistical Inference for Spatial Poisson Processes Yu A. Kutoyants, 2012-12-06 This work is devoted to several problems of parametric mainly and nonparametric estimation through the observation of Poisson processes defined on general spaces Poisson processes are quite popular in applied research and therefore they attract the attention of many statisticians There are a lot of good books on point processes and many of them contain chapters devoted to statistical inference for general and particular models of processes There are even chapters on statistical estimation problems for inhomogeneous Poisson processes in asymptotic statements Nevertheless it seems that the asymptotic theory of estimation for nonlinear models of Poisson processes needs some development Here nonlinear means the models of inhomogeneous Poisson processes with intensity function nonlinearly depending on unknown parameters In such situations the estimators usually cannot be written in exact form and are given as solutions of some equations However the models can be quite fruitful in engineering problems and the existing computing algorithms are sufficiently powerful to calculate these estimators Therefore the properties of estimators can be interesting too **Mathematical Methods of Statistics**, 2007 **Lectures on Random Voronoi Tessellations** Jesper Møller, 2012-12-06 Tessellations are subdivisions of d dimensional space into non overlapping cells Voronoi tessellations are produced by first considering a set of points known as nuclei in d space and then defining cells as the set of points which are closest to each nuclei A random Voronoi tessellation is produced by supposing that the location of each nuclei is determined by some random process They provide models for many natural phenomena as diverse as the growth of crystals the territories of animals the development of regional market areas and in subjects such as computational geometry and astrophysics This volume provides an introduction to random Voronoi tessellations by presenting a survey of the main known

results and the directions in which research is proceeding Throughout the volume mathematical and rigorous proofs are given making this essentially a self contained account in which no background knowledge of the subject is assumed

Series Approximation Methods in Statistics John E. Kolassa, 2013-04-17 This book was originally compiled for a course I taught at the University of Rochester in the fall of 1991 and is intended to give advanced graduate students in statistics an introduction to Edgeworth and saddlepoint approximations and related techniques Many other authors have also written monographs on this subject and so this work is narrowly focused on two areas not recently discussed in theoretical text books These areas are first a rigorous consideration of Edgeworth and saddlepoint expansion limit theorems and second a survey of the more recent developments in the field In presenting expansion limit theorems I have drawn heavily on the notation of McCullagh 1987 and on the theorems presented by Feller 1971 on Edgeworth expansions For saddlepoint notation and results I relied most heavily on the many papers of Daniels and a review paper by Reid 1988 Throughout this book I have tried to maintain consistent notation and to present theorems in such a way as to make a few theoretical results useful in as many contexts as possible This was not only in order to present as many results with as few proofs as possible but more importantly to show the interconnections between the various facets of asymptotic theory Special attention is paid to regularity conditions The reasons they are needed and the parts they play in the proofs are both highlighted

Wavelets, Approximation, and Statistical Applications Wolfgang Härdle, Gerard Kerkycharian, Dominique Picard, Alexander Tsybakov, 2012-12-06 The mathematical theory of ondelettes wavelets was developed by Yves Meyer and many collaborators about 10 years ago It was designed for approximation of possibly irregular functions and surfaces and was successfully applied in data compression turbulence analysis image and signal processing Five years ago wavelet theory progressively appeared to be a powerful framework for nonparametric statistical problems Efficient computational implementations are beginning to surface in this second lustrum of the nineties This book brings together these three main streams of wavelet theory It presents the theory discusses approximations and gives a variety of statistical applications It is the aim of this text to introduce the novice in this field into the various aspects of wavelets Wavelets require a highly interactive computing interface We present therefore all applications with software code from an interactive statistical computing environment Readers interested in theory and construction of wavelets will find here in a condensed form results that are somewhat scattered around in the research literature A practitioner will be able to use wavelets via the available software code We hope therefore to address both theory and practice with this book and thus help to construct bridges between the different groups of scientists This text grew out of a French German cooperation Seminaire Paris Berlin Seminar Berlin Paris This seminar brings together theoretical and applied statisticians from Berlin and Paris This work originates in the first of these seminars organized in Garchy Burgundy in 1994

SCIENCES **Journal of the Indian Statistical Association** Indian Statistical Association,2011 Selecting Models from Data P. Cheeseman,R.W. Oldford,2012-12-06 This volume is a selection of papers presented at the Fourth International Workshop on Artificial Intelligence and Statistics held in January 1993 These biennial workshops have succeeded in bringing together researchers from Artificial Intelligence and from Statistics to discuss problems of mutual interest The exchange has broadened research in both fields and has strongly encouraged interdisciplinary work The theme of the 1993 AI and Statistics workshop was Selecting Models from Data The papers in this volume attest to the diversity of approaches to model selection and to the ubiquity of the problem Both statistics and artificial intelligence have independently developed approaches to model selection and the corresponding algorithms to implement them But as these papers make clear there is a high degree of overlap between the different approaches In particular there is agreement that the fundamental problem is the avoidance of overfitting Le where a model fits the given data very closely but is a poor predictor for new data in other words the model has partly fitted the noise in the original data *Annales de L'I.H.P.* ,2002 **Encyclopedia of Statistical Sciences , Update** Samuel Kotz,Campbell B. Read,David L. Banks,1997 Keeping pace with the latest developments in all branches of statistical science Encyclopedia of Statistical Sciences is the number one source of information on statistical theory methods and applications for researchers and clinicians This new volume is the last of three updates designed to bring the Encyclopedia in line with new and emerging topics and important advances in statistical science made over the past decade Each self contained entry is written by a leader in the field and easily understood by readers with a modest statistical background In addition to the main selections which feature fascinating discussions of developments in various branches of the statistical sciences readers will find a series of shorter entries ranging in subject matter from the lives of pioneers in statistics to updates of earlier articles and reviews of statistical agencies and journals Up to date bibliographies thorough cross referencing and extensive indexing facilitate quick access to specific information and provide an indispensable platform for further study and research A cumulative index and listing of all the entries in the 13 volumes of the Encyclopedia together with the corresponding authors are included With the publication of this update installment the Encyclopedia of Statistical Sciences retains its position as the only cutting edge reference of choice for those working in statistics probability theory biostatistics quality control and economics and in applications of statistical methods in sociology engineering computer and communication science biomedicine psychology and many other areas
