**Immunotherapies** Arun Kumar, Shakti Singh, 2016-03-15 Influenza virus infections lead to thousands of deaths worldwide annually and billions of dollars economic burden. Despite continuing advances in our understanding of the immune evasion mechanism, the disease remains one of the foremost threats for human beings. Traditional vaccines, attenuated and inactivated, mainly provide protection by inducing virus neutralizing antibodies targeting ever-changing surface antigens: Haemagglutinin (HA) and Neuraminidase (NA). Due to genetic shift and immune selection pressure, prevalence of circulating influenza virus subtypes changes every year. Therefore, mismatch between circulating strain and vaccine strain can critically affect the success rate of these conventional flu vaccines and requires continuous monitoring of circulating influenza virus subtypes and change in the vaccine formulations accordingly. The collective limitations of existing flu vaccines urgently call for the development of a novel universal vaccine that might provide the required protective immunity to a range of influenza virus subtypes. New approaches are being investigated, mainly targeting conserved regions of flu proteins. Some of these approaches include universally conserved epitopes of HA, nucleoprotein (NP), capsid protein (M1) and ion channel protein (M2) that induced strong immune responses in animal models. Some attention and progress appears to be focused on vaccines based on the M2 ectodomain (M2e) employing a variety of constructs, adjuvants and delivery systems including M2e, hepatitis B core antigen, flagellin constructs and virus-like particles (VLP). Animal studies with these M2e candidate vaccines demonstrated that these vaccine candidates can prevent severe illness and death but not infection, which may pose difficulties in both the evaluation of clinical efficacy and approval by the regulatory authorities. VLP vaccines appear to be promising but still are mostly limited to animal studies. The discovery and development of new and improved vaccines have been greatly facilitated by the application of new technologies. The use of nucleic acid-based vaccines to combine the benefits of in situ expression of antigens with the safety of inactivated and subunit vaccines has been a key advancement. Upon their discovery more than 20 years ago, nucleic acid vaccines promised to be a safe and effective means to mimic immunization with a live organism vaccine, particularly for induction of T cell immunity. In addition, the manufacturing of nucleic acid-based vaccines offered the potential to be relatively simple, inexpensive and generic. Reverse vaccinology and in silico designing of vaccines are very innovative approaches and being considered as future of vaccines. Furthermore, various immuno-therapeutic agents also being developed to treat and minimize immuno-pathological damage in patients suffering from life-threatening complications. For the treatment of such pathological conditions, various novel approaches such as administration of immune suppressive cytokines, blocking co-stimulatory signals or activating co-inhibitory signal of T cell activation are being tested both in lab and clinics. The Research Topic on influenza virus vaccine and therapeutics will give an insight into the current status and future scope of these new innovative approaches and technologies. Moreover, these new methods will also serve as a reference tool for the development of future vaccines against several other pathogens. Acute Virus Infections of Poultry J.B.

McFerran, M.S. McNulty, 2012-12-06 This book is based on the proceedings of a seminar on acute viral infections of poultry.

which was held in Brussels on 13 14 June 1985 The aim of the seminar which was sponsored by the CEC was to gather information on those infections of immediate or increasing importance It is hoped that dissemination of this information will make it easier to harmonize diagnostic and control measures throughout the member states of the EEC Several points emerge from recent outbreaks of highly pathogenic avian influenza In view of the apparent change in pathogenicity of the virus involved in the outbreak in the USA infections of domestic poultry particularly with H5 and H7 sub types should be regarded as a potential threat even if the viruses involved are of low pathogenicity The reasons for the amount of lateral spread which occurred in the USA outbreak are still not clear and it can not be assumed that future outbreaks of highly pathogenic avian influenza will tend to be self limiting as in the past The importance of denying access of wild birds particularly water fowl to domestic poultry needs to be re emphasised Lastly there appears to be increasing support for a combination of slaughter and ring vaccination to control future outbreaks of spreading avian influenza
