Petri Synthesis Theoretical Computer Science:

Petri Net Synthesis Eric Badouel, Luca Bernardinello, Philippe Darondeau, 2015-11-02 This book is a comprehensive systematic survey of the synthesis problem and of region theory which underlies its solution covering the related theory algorithms and applications. The authors focus on safe Petri nets and place/transition nets P/T nets treating synthesis as an automated process which given behavioural specifications or partial specifications of a system to be realized decides whether the specifications are feasible and then produces a Petri net realizing them exactly or if this is not possible produces a Petri net realizing an optimal approximation of the specifications. In Part I the authors introduce elementary net synthesis. In Part II they explain variations of elementary net synthesis and the unified theory of net synthesis. The first three chapters of Part III address the linear algebraic structure of regions synthesis of P/T nets from finite initialized transition systems and the synthesis of unbounded P/T nets. Finally the last chapter in Part III and the chapters in Part IV cover more advanced topics and applications. P/T net with the step firing rule extracting concurrency from transition systems, process discovery, supervisory control and the design of speed independent circuits. Most chapters conclude with exercises and the book is a valuable reference for both graduate students of computer science and electrical engineering and researchers and engineers in this domain.

Agrawal, Anil Seth, 2003-07-01 This volume consists of the proceedings of the 22nd International Conference on the Foundations of Software Technology and Theoretical Computer Science (FSTTCS 2002) organized under the auspices of the Indian Association for Research in Computing Science (IARCS). The conference was held at the Indian Institute of Technology Kanpur during December 12-14, 2002. The conference attracted 108 submissions of which two were withdrawn. Of these a total of 26 papers were selected for presentation in the conference. As in the last year the PC meeting was held electronically stretching over nearly three weeks in August 2002 and was a great success. In addition to the contributed papers we had invited speakers this year: Hendrik Lenstra Jr, Harry Mairson, Dale Miller, Chih Hao Ong and Margus Veana. We thank them for accepting our invitation and for providing abstracts or even full papers for the proceedings. Two workshops were organized in conjunction with the conference both in Kanpur. A workshop on Parameterized Complexity was held during December 10-11 organized by Mike Fellows and Venkatesh Raman. The second workshop actually consisted of three miniworkshops on Coding Theory by Madhu Sudan, on Finite Field Algorithms by Hendrik Lenstra Jr and on Sieve Theory by R. Balasubramanian. We wish to thank all the reviewers and PC members who contributed greatly to making the conference a success. We also wish to thank the team at Springer Verlag for their help in preparing the proceedings.

Sobh,2006 The underlying mathematical representation of complex robotic and manufacturing computer controlled systems is still insufficient to create a set of models which accurately captures the dynamics of the system over the entire range of system operation We remain in a situation where we must trade off the accuracy of our models with the manageability of the models Closed form solutions of mathematical models are almost exclusively limited to linear system models Computer simulation of non linear hybrid and discrete event models provide a means for online design of robotic control systems Guarantees of system performance are limited to those regions where the robustness conditions apply These conditions may not apply during start up and shutdown or during periods of anomalous operation Attempts have been made to model low and high level system changes in automated and robotic systems as discrete event dynamic systems DEDS and hybrid systems Several attempts to improve modelling capabilities are focused on mapping the continuous world into a discrete one However repeated results are available which indicate that large interactive systems evolve into states where minor events can lead to a catastrophe Discrete event and hybrid systems have been used in the manufacturing and automation domains to model system state changes within a process Timed and untimed petri nets and state automata in addition to Markovian stochastic perturbation and other models have been used extensively to model and control automated manufacturing systems High level DEDS controllers have also been to guide the behaviour of robots based on sensory outputs This book presents a collection of problems modelling strategies analysis tools and theoretical frameworks for discrete events and hybrid systems within the robotics and automation domain Structures in Concurrency Theory Jörg Desel,1995-10-13 This is the latest volume in the Workshops in Computing series and contains the papers presented at the International Workshop on Structures in Concurrency Theory STRICT held in Berlin from 11 13 May 1995 Concurrency theory deals with formal aspects of concurrent systems It uses partly competing and partly complementary formalisms and structures This workshop was jointly organised by the Humboldt Universit t zu Berlin and the ESPRIT Basic Research Working Group CALIBAN CALIBAN and its predecessor DEMON are ESPRIT Basic Research projects with the aim of developing design methodologies based on causal models such as Petri nets The workshop marked the third year of the project and surveyed the results of CALIBAN and

Chlebus,Ludwik Czaja,1997-08-06 This book deals with the efficient numerical solution of challenging nonlinear problems in science and engineering both in finite dimension algebraic systems and in infinite dimension ordinary and partial differential equations Its focus is on local and global Newton methods for direct problems or Gauss Newton methods for inverse problems The term affine invariance means that the presented algorithms and their convergence analysis are invariant under one out of four subclasses of affine transformations of the problem to be solved Compared to traditional textbooks the distinguishing affine invariance approach leads to shorter theorems and proofs and permits the construction of fully adaptive algorithms Lots of numerical illustrations comparison tables and exercises make the text useful in computational mathematics classes At the same time the book opens many directions for possible future research *Fundamentals of Computation Theory* ,1997 *Formal Methods and Software*
