

# Mystery Powder Lab!

**Purpose:** One of the employees at our company spilled some of our powders. We now have an unknown substance that we need to help identify. You will want to learn the properties of each white powder before trying to figure out the mystery combination!

**Background:** The shape, smell, color, size and how an item reacts are called properties. Some properties are physical and some are chemical. The color, shape, and size are physical properties of an object. Physical properties can be observed without changing the chemical property. Chemical properties include how an object behaves or reacts to something such as an acid. For us to use a chemical property, an item has to actually change chemically. Chemicals are the elements that study the properties of a substance. Both chemical and physical properties are used to identify an item.

In forensic science and chemistry, being able to identify and analyze unknown substances is very important. A police officer might find a white powder at a suspect's house, like the poison master's pot to find out if that white powder is flour, sugar, or a illegal drug. With the use of scientific problem solving, the mystery powder can almost always be correctly identified.

## Materials:

Corn Starch	Mystery Powder	Magnifying Glass
Salt	Water	Reaction Plate
Plaster of Paris	Vinegar	Eyedropper
Baking Soda	Table Salt 10%	Stopper

## Procedure:

- Use the spoon to put the same amount of corn starch in  both of the wells of your reaction plate.
- Observe the powder with your magnifying glass and record your observations in the data table below.

Process	Magnifying Glass Observations	Water	Vinegar	Stopper
Corn starch				
Salt				
Plaster of Paris				
Baking Soda				
Mystery Powder				

- Use the spoon to place 10 drops of water into well 1. Use with your toothpick and then observe how well the powder dissolved in the water. Record this in the data table.
- Gently squeeze 3 drops from the bottle of vinegar into well 2. Observe the color of your powder. Record your observations in the data table.

Vinegar is an **acid** or **base**, meaning that it changes if something has been in it. It will turn **colorless** if the powder doesn't have any starch, but will turn **blue-black** or **purple** if the powder has starch in it. If you have extra vinegar after this experiment, try heating some of the foods in your kitchen to see if they have starch in them.

- Gently squeeze 3 drops from the bottle of vinegar into well 3. Observe what happens and record your observations in the data table. Vinegar will react with bases (chemicals other an acid or a base, but special kinds of chemicals). Examples of acids are lemon juice, vinegar and coffee. Examples of bases are bleach, soap and baking soda. When an acid reacts with a base they react to each other to form a new substance.
- Carefully rinse and dry your stopper and reaction plate.
- Repeat steps 1-3 with the salt, plaster of paris, and baking soda.
- Now it is time to figure out your mystery powder! Follow steps 1-4 with it and then use its properties to figure out which two powders combined to make it.

What the mystery powder is a mixture of \_\_\_\_\_ and \_\_\_\_\_ because \_\_\_\_\_

## Questions:

- What properties did all of the powders have in common?
- How can you tell the difference between Cornstarch and Plaster of Paris?
- How can you tell the difference between Salt and Baking Soda?
- How could properties help you tell the difference between each powder?
- What is a physical property? Give an example.
- What is a chemical property? Give an example.

## Extensions:

Signs that a chemical change has taken place are a change in color, smell, or temperature. Gas bubbles can form and you might hear a sound. Did you see any of these signs when you were testing the mystery powder? Put a star in each box of the data table where a chemical change took place.
