Bock, 2023-03-08 The international New Math developments between about 1950 through 1980 are regarded by many mathematics educators and education historians as the most historically important development in curricula of the twentieth century It attracted the attention of local and international politicians of teachers and of parents and influenced the teaching and learning of mathematics at all levels kindergarten to college graduate in many nations After garnering much initial support it began to attract criticism But as Bill Jacob and the late Jerry Becker show in Chapter 17 some of the effects became entrenched This volume edited by Professor Dirk De Bock of Belgium provides an outstanding overview of the New Math modern mathematics movement Chapter authors provide exceptionally high quality analyses of the rise of the movement and of subsequent developments within a range of nations The first few chapters show how the initial leadership came from mathematicians in European nations and in the United States of America The background leaders in Europe were Caleb Gattegno and members of a mysterious group of mainly French pure mathematicians who since the 1930s had published under the name of a fictitious Nicolas Bourbaki In the United States there emerged during the 1950s various attempts to improve U S mathematics curricula and teaching especially in secondary schools and colleges This side of the story climaxed in 1957 when the Soviet Union succeeded in launching Sputnik the first satellite Undoubtedly this is a landmark publication in education The foreword was written by Professor Bob Moon one of a few other scholars to have written on the New Math from an international perspective The final epilogue chapter by Professor Geert Vanpaemel a historian draws together the overall thrust of the volume and makes links with the general history of curriculum development

especially in science education including recent globalization trends

Remillard, Beth A. Herbel-Eisenmann, Gwendolyn M. Lloyd, 2011-09-20 This book compiles and synthesizes existing research on teachers' use of mathematics curriculum materials and the impact of curriculum materials on teaching and teachers with a particular emphasis on but not restricted to those materials developed in the 1990s in response to the NCTM's Principles and Standards for School Mathematics. Despite the substantial amount of curriculum development activity over the last 15 years and growing scholarly interest in their use, the book represents the first compilation of research on teachers and mathematics curriculum materials and the first volume with this focus in any content area in several decades. Noss, Celia Hoyles, 2012-12-06 This book is the culmination of some ten years' theoretical and empirical investigation. Throughout this period we have come into contact with many who have stimulated our thinking, some of whom belong to the community of Mathematics Educators. Our membership of that community has challenged us to make sense of some deep issues related to mathematical learning, especially the cognitive and pedagogical faces of mathematical meaning-making. Alongside this community we are privileged to have been part of another whose members are centrally concerned both with mathematics and education. Yet many of them might reject the label of Mathematics Educators. This community has historically been clustered around what is now called the Epistemology and Learning Group at the Massachusetts Institute of Technology. Their work has focused our attention on cognitive science, ethnography, sociology, artificial intelligence, and other related disciplines. Crucially, it has forced our awareness of the construction of computational settings as a crucial component of the struggle to understand how mathematical learning happens. We have sometimes felt that few have tried to span both communities. Indeed, an analysis of the references in the literature would, we are sure, reveal that the two communities have often ignored each other's strengths. One reason for writing this book is born of our hope that we might draw together Mathematics Educators and mathematics educators and assist both communities in recognising that there are insights that might be derived from each other. **Transnational Synergies in School Mathematics and Science Debates** Roger

Openshaw, Margaret Walshaw, 2019-10-02 This book highlights and interrogates the continued interest and scrutiny of mathematics and science education. National debates on excellence and equity tend to focus largely on underachievement in mathematics and science rather than subjects in the arts or music; this is due to a belief that these curriculum areas are central to individual workplace success and national development in a competitive economic environment. The authors explore the history of these assumptions as well as the debates based around claims that student achievement levels in these subjects has fallen. Spanning the United States, New Zealand, Australia, and the United Kingdom, the chapters question how such debates are sustained and amplified, how this perceived crisis has been articulated and spread across national borders. This comprehensive book will be of interest and value to scholars of mathematics and science education as well as
