Scientific and Clinical Applications of Magnetic Carriers Urs Häfeli, Wolfgang Schütt, Joachim Teller, Maciej Zborowski, 2013-11-11 The discovery of uniform latex particles by polymer chemists of the Dow Chemical Company nearly 50 years ago opened up new exciting fields for scientists and physicians and established many new biomedical applications Many in vitro diagnostic tests such as the latex agglutination tests analytical cell and phagocytosis tests have since become routine They were all developed on the basis of small particles bound to biological active molecules and fluorescent and radioactive markers Further developments are ongoing with the focus now shifted to applications of polymer particles in the controlled and directed transport of drugs in living systems Four important factors make microspheres interesting for in vivo applications First biocompatible polymer particles can be used to transport known amounts of drug and release them in a controlled fashion Second particles can be made of materials which biodegrade in living organisms without doing any harm Third particles with modified surfaces are able to avoid rapid capture by the reticuloendothelial system and therefore enhance their blood circulation time Fourth combining particles with specific molecules may allow organ directed targeting
