**Microbiology** = the study of micro-organisms (microbes)

- **Microbes** = organisms that cannot be readily seen without a microscope
- **Medical microbiology** = the medical implications of microbes (how they cause diseases)
- Viral pathogens -> not a microbe because it is not actually a living thing

Micrometer, micron,  $\mu\text{m}$

- 0.000001 meter = 1 micrometer

How many human cells are in the body

- More than 30 trillion
- Emphasis on *human* cells because that excludes the other microbes and microorganisms

Organizing microbes

- Classification
  - **Carl Linnaeus** is founder of modern taxonomy
    - *Systema Naturae*
      - 1) Animals
      - 2) Plants
      - 3) Minerals
    - **Taxonomy** = the classification, description, identification, and naming of living organisms
- Defining properties
  - **Ernst Haeckel** made the first phylogeny (tree) to include a kingdom for protista and bacteria
    - **Protista** = single cell organisms
    - **Monera** = bacteria
  - Before this, we didn't have a way of classifying things to this level (so tiny)
    - Greatest success was that it showed the relatedness of organisms
  - **Phylogeny** = depiction of the evolutionary history of a group of organisms
- A **taxon** is based on increasing specificity of the characteristics of a group of organisms
